(Continued from page 1299)

There were nineteen states that offered continuation study for the practicing physician in or near their home communities. Continuation study in centers where there are ample clinical facilities were offered in thirty-two states and the District of Columbia. Graduate assemblies in twenty-eight states.

The approximate attendance reported at these circuit courses totaled 37,611. The individual registration of these groups was 11,029 for courses offered in or near home communities, 14,879 for centers where there are ample clinical facilities and 11,703 for clinical conferences, graduate assemblies and study courses.

The study of general medical and surgical subjects the specialties and subspecialties in various combinations were offered. Clinical instruction and practical experience included laboratory and operative demonstrations, symposiums, seminars, assignment of patients, case presentation, clinical pathologic and roentgen ray conferences, movies, ward rounds, field trips and bedside teaching.

COMMENT

The registration for these three types of courses was lower than that reported for the session 1940-1941, when 43,621 individuals attended courses. The drop in attendance was in courses offered to physicians in or near their home communities and in the graduate assemblies, while in centers providing ample clinical facilities the attendance exceeded that for 1940-1941 by 2,331. As a result of the exigencies of the war, several programs were canceled. Furthermore, medical schools report that, because of unsettled conditions, the institution of the accelerated program of undergraduate medical education and because their faculties have been so depleted, it would be difficult for them to plan any activity aside from undergraduate instruction in the immediate future. Many state medical societies and departments of health are curtailing or discontinuing refresher courses because of lack of adequate personnel to conduct them.

Although the many difficulties in connection with the conduct of continuation and refresher courses during the war are fully appreciated, it is hoped that they will be continued as far as possible. Considerable thought should be given to the selection of subjects for the programs offered. These will naturally differ in the various localities. The war will undoubtedly present to the physicians in civilian practice many new and difficult problems. Thus state medical societies and other agencies may be in a position to make a great contribution by dealing with these problems in such continuation and refresher courses as they are in a position to offer.

For the past year the Council has gathered data on proposed courses and has published this material at quarterly intervals in THE JOURNAL. Included in this summary, in addition to the name of the institution and location, is given the date when instruction begins, the length and content of the courses, the type of instruction offered, the number of physicians accepted for each course and their eligibility, the instructors participating and the fee charged.

The House of Delegates of the American Medical Association, at its annual meeting in June 1942, instructed the Council to develop a program of refresher courses for physicians returning to civilian practice after the war and study the problem involved in the provision of opportunities for the further training of young men who have entered the armed forces after the completion of one year of internship.

# APPROVED INTERNSHIPS

Council on Medical Education and Hospitals of the American Medical Association  
335 North Dearborn Street Chicago

Revised to Aug 15 1942

The following general hospitals are considered in position to furnish acceptable internships of at least one year duration. They are also accredited to furnish internships which represent general assignments following an approved intern service. The + sign indicates additional approval for residents in specialties.

HOSPITALS, 739 INTERNSHIPS, 8,349  
CAPACITY, 258,660 BEDS

The terms used in the column Type of Internship are defined as follows:  
1. A full rotating intern provides training in medicine, surgery, pediatrics, obstetrics, pathology and radiology. (May and laboratory duties may be combined with clinical services or constitute separate assignments.)

A mixed or limited rotating internship covers more than one of the clinical specialties but does not include all of the divisions listed above.  
A straight internship is an assignment limited to a single department but may include the subspecialties of the same branch. Straight internships are now approved in the divisions of medicine, surgery, pediatrics, pathology, obstetrics and obstetrics-gynecology.

The following list of approved internships has been revised to date of publication in order to record the changes that have recently occurred in relation to military needs and the requirements of the present accelerated program of medical education. The clinical data included in this list are for the year 1941 but information concerning the type of internship offered, number of interns, length of service, date of appointment, beginning of service and monthly stipend is reported as at July 1942. The bed capacity and admissions in federal hospitals included in this list are identical with the data published in the Hospital Number of THE JOURNAL A M A March 28 1942.

| Name of Hospital  | Location       | Control | Capacity | Total Patients Admitted | % Service Cases | % Priv. vs. Worked Up by Interns | Type of Internship | Interns Appointed Annually | Length of Service in Months | Service Commences | Admitted Service | Outpatient Service | Autopsy Percentage | Stipend per Month | Appointments Made |

## HOSPITALS APPROVED FOR INTERNSHIPS IN THE DOMINION OF CANADA

For the benefit of graduates of approved medical colleges who desire an Internship in Canada, the Council on Medical Education and Hospitals of the American Medical Association has declared that hospitals which conform to the standards of the Department of Hospital Service of the Canadian Medical Association should be regarded as giving an Internship equivalent in educational value to that offered by hospitals in the United States approved for intern training by the Council. It is understood, however, that this statement applies only to hospitals that are unqualifiedly "Approved" under the Canadian plan and does not apply to that group referred to as "Commended."

The following list of hospitals, revised to June 1, 1942, has been furnished by the Department of Hospital Service

| Name of Hospital                      | Location      | Name of Hospital           | Location          | Name of Hospital             | Location         |

# APPROVED RESIDENCIES AND FELLOWSHIPS

Council on Medical Education and Hospitals of the American Medical Association,  
535 North Dearborn Street, Chicago

Hospitals, 662, Residencies, 4,948, Fellowships, 539

The following institutions approved by the Council on Medical Education and Hospitals are considered in position to furnish acceptable training in various specialties as indicated below. Residencies in specialties, as defined by the Council, are straight services of one or more years following an approved internship. A fellowship is a form of apprenticeship which in some cases is indistinguishable from a residency, although it usually offers greater opportunity for the study of basic sciences and research. Ordinarily a fellowship is a university rather than a hospital appointment. Mixed residencies are general hospital assignments following internship. They include services classified as general residencies and chief residencies.

The star (\*) indicates hospitals that are also approved for the training of interns. All hospitals on the approved intern list are likewise accredited for general or mixed residencies.

## INDEX TO LIST

|                               | Page |                                     | Page |                      | Page |
|-------------------------------|------|-------------------------------------|------|----------------------|------|
| 1 Anesthesia                  | 1322 | 10 Neurology                        | 1327 | 19 Plastic surgery   | 1336 |
| 2 Cardiology                  | 1322 | 11 Neurosurgery                     | 1327 | 19 Psychiatry        | 1336 |
| 3 Communicable diseases       | 1323 | 12 Obstetrics and gynecology        | 1328 | 20 Radiology         | 1338 |
| 4 Dermatology and syphilology | 1323 | 11 Ophthalmology and otolaryngology | 1330 | 21 Surgery           | 1339 |
| 5 Epilepsy                    | 1324 | 11 Orthopedic surgery               | 1332 | 22 Thoracic surgery  | 1342 |
| 6 Fractures                   | 1323 | 15 Pathology                        | 1333 | 23 Traumatic surgery | 1342 |
| 7 Malignant diseases          | 1323 | 16 Pediatrics                       | 1335 | 24 Tuberculosis      | 1342 |
| 8 Medicine                    | 1324 | 17 Physical therapy                 | 1336 | 25 Urology           | 1343 |
| 9 Mixed residency             | 1326 |                                     |      |                      |      |

The information contained in the following list is based on reports received in January 1942 and thus represents the educational facilities that are ordinarily available in the specialty fields under normal conditions. Many residency programs have since been curtailed because of military requirements but there is every indication that the approved hospitals are maintaining their educational structure so as to be able to meet current and future residency needs.

## 1 ANESTHESIOLOGY

Revision of list is now taking place in collaboration with the American Board of Anesthesiology

|  | Chief of Service                  | Inpatients Treated | Total Anesthetics | Inhalation Anesthetics | Autopsy Percentage | Residents | Assistant Residents | Fellows | Service Begins | Length of Service (Years) | Beginning Stipend |

Mayo Foundation Fellowships—The Mayo Foundation for Medical Education and Research, Rochester, Minnesota, D C Balfour director three year fellowships beginning quarterly leading to the degree of M S or Ph D with field named from the University of Minnesota in Anesthesiology, Dermatology and Syphilology, Internal Medicine, Neurology and Psychiatry, Neurosurgery, Obstetrics and Gynecology, Ophthalmology, Orthopedic Surgery, Otolaryngology, Pathology, Pediatrics, Physical Medicine, Plastic Surgery, Proctology, Radiology, Surgery, Urology, stipend \$900 per year, (clinical fellowships including pathology and radiology—268)

- Compensation arranged by medical school and hospital
- As reported in 1940
- In lieu of maintenance
- Additional teaching material in outside clinics
- Central Free Dispensary, Chicago
- Includes two fellowships in gastroenterology
- Affiliated with Falk Clinic, Pittsburgh
- Clinical data includes neurosurgery
- Outpatient and home delivery service only
- Assistant residents serve four months
- Obstetrical training at Herman Klefer Hospital, Detroit
- Training in Gynecology at City of Detroit Receiving Hospital
- Training in Gynecology at Barnes Hospital, St. Louis
- House staff includes 8 interns
- Includes 9 months at Chicago Lying In Hospital
- Separate residencies of eighteen to thirty six months also available
- Appointments made every two months
- Affiliated with Washington University Clinics
- March November 1941
- In affiliation with Northwestern University and Passavant Hospital
- Additional surgical material at Worcester Hahnemann Hospital
- Residencies open to women
- Approved by the Board as offering satisfactory one year training
- Approved by the Board as offering satisfactory two year training

- Approved by the Board as offering satisfactory three year training
- Includes orthopedics
- Inputients Numbers refer to total inpatients treated in specialty
- Obstetrical admissions do not include newborns in pathology and anesthesiology total hospital admissions are used
- Data as reported in 1940
- Includes neurosurgery
- Includes affiliate service at South Bend Medical Laboratory, St. Joseph Hospital, South Bend, Elkhart General Hospital, Elkhart, and St. Joseph's Hospital, Mishawaka
- Affiliated with Free Hospital for Women, Brookline Mass
- Approved by the Board as offering satisfactory one year training
- Approved by the Board as offering satisfactory two year training
- Approved by the Board as offering satisfactory three year training
- Medical and surgical pediatrics included in statistical data
- Represents training acceptable to Board in (1) radiology, (2) roentgenology, (3) therapeutic radiology or (4) diagnostic roentgenology
- Affiliated with Pima County Hospital, Tucson
- Includes acceptable affiliate assignment at Urologic Clinic, Phila
- Affiliated with Northwest Clinic, Minot
- Includes Neurology
- Includes Bradford Memorial Hospital for Babies, Children's Hospital of Texas, and Freeman Memorial Children's Clinic, Dallas, Texas

## APPROVED EXAMINING BOARDS IN MEDICAL SPECIALTIES

In 1933 the Council on Medical Education and Hospitals of the American Medical Association was authorized by the House of Delegates of the American Medical Association to formulate standards and approve examining boards in the medical specialties. The resolution urged that the machinery of the American Medical Association including the publication of the American Medical Directory be used in furthering the work of boards accredited under this plan. Examining and certifying boards had already been established in ophthalmology, otolaryngology, obstetrics and gynecology, and dermatology and syphilology but it was believed that there was need for a universal standard governing all fields of medical practice in order that properly qualified physicians might readily be recognized.

Standards governing the approval of specialty boards were compiled by the Council and approved by the House of Delegates in 1934 and have since been revised. The Essentials of Approved Examining Boards in Specialties include, in addition to regulations relating to the organization and operation of specialty boards the minimum qualifications deemed necessary for certification as a specialist, namely, graduation from a medical school approved by the Council on Medical Education and Hospitals, an internship in a hospital approved by the Council and a period of specialized training in a selected field.

Eleven boards have been organized since 1933. These boards, together with the four previously operating are now fully approved by the Council and represent the specialties of anesthesiology, dermatology and syphilology, internal medicine, neurologic surgery, obstetrics and gynecology, ophthalmology, orthopedic surgery, otolaryngology, pathology, pediatrics, plastic surgery, psychiatry and neurology, radiology, surgery and urology. The American Board of Internal Medicine by special examination certifies specialists in allergy, cardiovascular disease, gastroenterology and tuberculosis. Similarly the American Board of Surgery certifies specialists in proctology.

A key number has been assigned to each approved specialty board such as A B I and the biographic records of physicians published in the American Medical Directory include by this means reference to those certified by these boards.

Early in 1939 there was published by the Advisory Board for Medical Specialties the first edition of the Directory of Medical Specialists containing the names and biographic data of all men certified by the several specialty boards as well as information regarding the organization and functions of these boards. The second edition appeared early in 1942 and contains the names of about 18,000 certified specialists, including their biographic records and hospital and teaching appointments.

Each of these boards has published a booklet containing a brief statement regarding its organization, personnel, purposes and qualifications for eligibility for certification. The data contained in these announcements are reproduced herewith.

The national emergency will greatly curtail the future training of young men to meet the requirements of the specialty boards, since no provision has been made for

military determent beyond the internship. In February 1942 the Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association appointed a committee to formulate plans to submit to the military authorities whereby a percentage of interns may be given an opportunity to continue their training in the special fields of medicine. This committee was informed that until the immediate needs of the Army for medical personnel were satisfied it would be difficult to expect determent of young men for graduate training. However, later when the Medical Corps of the Army is more adequately filled it is hoped that consideration will be given to the determent of certain men for graduate training.

The specialty boards have not lowered their requirements because of war conditions, but the majority of them will grant some credit for military service. In response to a recent inquiry the specialty boards have indicated such allowances as follows:

*Anesthesiology*—Credit of one year toward the five year period regardless of the type of service. If assigned to the specialty in the armed forces of the United States, applicants may receive a maximum credit of one year toward the two year specific training period.

*Dermatology and Syphilology*—If a candidate is called into active military or naval service he will receive full credit for dermatologic training already finished at that time. The extent to which medical service in the Army or Navy will count toward the required training in dermatology and syphilology will be decided in each case on evidence submitted by the candidate. The board will accept not more than one year of military or naval medical service as part of the required two years' experience in dermatology and syphilology to be eligible for examination. A candidate who is called into military or naval service after completion of three years of training in dermatology and syphilology may take the complete examination of the board and if this examination is satisfactory a certificate will be issued after satisfactory completion of two years of further approved experience in dermatology and syphilology.

*Internal Medicine*—One year of military service in the United States Army, Navy or Marine Corps may be applied toward the satisfaction of one year of graduate training or one year of the practice of the specialty of internal medicine. This ruling admits of a substitution of military or naval service for one year of the three years of graduate training required, or one year of the two years of the practice of internal medicine.

*Neurologic Surgery*—Each case will be determined individually.

*Obstetrics and Gynecology*—An applicant entering military service and assigned to work in general surgery under conditions satisfactory to the board may receive credit toward the required special training up to a maximum of six months, applicable toward his three years of special training. Emergency military service may be counted as years of practice.

*Ophthalmology*—Every case will be considered individually on its own merits.

*Orthopedic Surgery*—During the present national emergency the board will recognize up to a maximum of one year for work done in the orthopedic division of the Army or Navy. If the foregoing fills out the three years of special required training for examination, further time spent in the orthopedic division of the armed forces, up to a maximum of one year, will be credited toward the practice requirement.

*Otolaryngology*—Each case will be determined on its merits.

*Pathology*—Each applicant from the military services will be considered individually and as much credit as possible will be

given for training and experience in the military services, depending on the station, supervision and equipment

*Pediatrics*—One year of credit will be allowed for one year of military service toward the required two years of specialized practice and/or study. Military service cannot be substituted for preliminary training

*Plastic Surgery*—Each case will be determined on its merits

*Psychiatry and Neurology*—Credit will be granted for military service to the extent of one year to the prescribed three year training period. It will also count for whatever experience is necessary to complete the two to three year requirement

*Radiology*—In the current emergency, one year of military service spent in a radiologic department in the United States Army, Navy or Marine Corps may be applied toward the satisfaction of one year of graduate training

*Surgery*—Full credit will be allowed for work done in the surgical division of a regularly constituted Army or Naval Hospital

*Urology*—Routine credit for military service will not be given. Each case will be determined on its merits

## AMERICAN BOARD OF ANESTHESIOLOGY, Inc

JOHN S LUNDY, President, Rochester, Minn  
HENRY S RUTH, Vice President, Merion Station, Pa  
PAUL M WOOD, Secretary-Treasurer, 745 Fifth Avenue, New York  
CHARLES F McCUSKEY, Glendale, Calif  
EMERY A ROVLASTINE, New York  
HARRY BOYD STEWART, Tulsa, Okla  
RALPH M TOVELL, Hartford, Conn  
RALPH M WATERS, Madison, Wis  
PHILIP D WOODBRIDGE, Philadelphia

### HISTORY

The plan for organization was devised to conform with those of other examining boards in medical specialties, by a committee representing the American Society of Anesthetists, Inc, the American Society of Regional Anesthesia, Inc, and the Section on Surgery of the American Medical Association. These organizations adopted the tentative plans submitted, and the formation of the American Board of Anesthesiology, Inc, an affiliate of the American Board of Surgery, Inc, was completed on June 2, 1937. The Advisory Board for Medical Specialties, and the Council on Medical Education and Hospitals of the American Medical Association approved the affiliation in 1938.

In 1941 the Advisory Board for Medical Specialties approved the establishment of the American Board of Anesthesiology, Inc, as a separate major board, with the unanimous consent of the participating societies and the surgical boards which are members of the Advisory Board.

Diplomates of this board will be designated "A B 13" in the Directory and Biographical Departments of the American Medical Association.

### PERSONNEL

The original members of the examining board were elected by the American Society of Regional Anesthesia, Inc, the American Society of Anesthetists, Inc, and the Section on Surgery of the American Medical Association. Each cooperating society had three representatives, thus giving national and regional representation in the composition of the board.

With the establishment of a separate major board, the members now represent the Section on Anesthesiology of the American Medical Association, the American Society of Anesthetists, Inc, the Section on Anesthesia of the Southern Medical Association and the New England Society of Anesthesiology.

The term of membership is for six years. Each cooperating association has the nominating power of its representatives, subject to the approval of the board.

### PURPOSES

- 1 To establish criteria of fitness to be designated a specialist in the practice of anesthesiology
- 2 To improve educational facilities and practice in medical schools and hospitals, and furnish lists of these, together with

lists of individual instructors who give adequate instruction and training in anesthesiology

3 To arrange, control, and conduct examinations to determine the qualifications, and grant a certificate to those who voluntarily apply and meet the required standards. Such certification will serve to provide the public and the professions with the opportunity to select the best available service. (Conferring of degrees is a prerogative of the universities, and the Board of Anesthesiology makes no attempt to grant degrees, regulate or control the practice of anesthesiology in any way whatsoever, by license or restriction.)

### VALUE OF CERTIFICATE

The organizations which participate in forming this board and sponsoring the activities as well as other societies or institutions, attach considerable importance to its certificate. The medical and lay public, as well as hospital directors, utilize the certification by this board in determining those who are well qualified as specialists in anesthesiology.

Although the Directory of the American Medical Association indicates those practicing in the various specialties the lists of holders of certification by specialty boards are available in the form of the Directory of Medical Specialists.

The American Board of Anesthesiology will cooperate with institutions and individuals in preparing plans for instruction in anesthesiology and in offering suggestions for the organization of new departments in the specialty.

### QUALIFICATIONS FOR ELIGIBILITY TO CERTIFICATION

A *General*—1 An applicant's moral and ethical standing in the profession must be satisfactory to the entire board. The board must be assured that the applicant is engaged in the practice of anesthesiology as a specialty and that he intends to continue to be so engaged.

2 Membership is required in the American Medical Association or membership in such other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association. Membership in other societies shall not be required.

3 Practice must be *limited* to anesthesiology.

4 In exceptional instances the board may, in its discretion, accept for examination candidates who have met all the preliminary requirements and have clearly demonstrated their identity as an anesthetist over a period of years but whose formal training does not comply with the full requirements to be exacted in the future.

B *Professional Standing*—1 An applicant must be a graduate of a grade A school in the United States or Canada recognized by the Council on Medical Education and Hospitals of the American Medical Association, or a graduate of an approved foreign school.

2 Satisfactory evidence must be supplied of completion of an internship of not less than one year in a hospital approved by the same council, or its equivalent in the opinion of the board.

3 An applicant must establish in a manner satisfactory to the Board of Anesthesiology that he is a physician duly licensed by law to practice medicine, that he is of high ethical and professional standing, and that he has received adequate special training in anesthesiology.

C *Special Training and Practice*—1 Before certification the candidate must have had an active experience limited to anesthesiology of not less than five (5) calendar years (including period of training).

2 The board recommends the inclusion of at least two years of carefully supervised instruction in the clinical phases of anesthesiology in hospital clinics, dispensaries, and diagnostic laboratories recognized by the Council on Medical Education and Hospitals of the American Medical Association as competent in the teaching and practice of anesthesiology. In addition, instruction in anatomy, physiology, pharmacology, biochemistry and other basic sciences which are necessary to the proper understanding of the problems involved in the specialty of anesthesiology is required.

(The board believes that for those entering the specialty after Jan 1, 1944, the facilities for special training in anesthesiology will be available and such training will be sufficiently standardized that special training in anesthesiology may be interpreted to include after that date.

(a) A period of study, after the internship, of not less than three years in clinics, dispensaries, hospitals, and laboratories recognized by the Council on Medical Education and Hospitals of the American Medical Association as competent to provide a satisfactory training in the special field of anesthesiology.)

# EXAMINATIONS

The qualifying examination will be divided into Part I, written, Part II, oral, and Part III, practical

## PART I

1 An applicant, to be eligible for Part I, must meet all requirements and his credentials must be approved by the board

2 At the board's discretion a candidate may apply for certification and may take the written examination on basic science and clinical practice on the completion of two years of his course of special training. Subsequently it shall be necessary for him to await the prescribed length of time to proceed with further examinations. Candidates who successfully pass Part I examinations (and satisfy the time requirement) proceed automatically to Part II examination

3 Part I may be given simultaneously in several centers throughout the United States, which the board may determine suitable for the purpose

## PART II

1 In order to be eligible for Part II a candidate must have successfully passed Part I in addition to having met the necessary requirements and having presented definite evidence of an adequate experience in anesthesiology satisfactory to the board

2 It is probable that Part II examinations will be held near the time and at the place of the annual convention of the American Medical Association. Later, however, as the demand grows, it may be necessary to establish subsidiary centers where this part may be held

## PART III

1 It is believed that the practical examination in this field is slightly different from that in most specialties. The examiners will observe the work of the candidates in their own or similar operating room surroundings, their relations to other staff members, and investigate their professional standing

## CONDUCT OF EXAMINATION

Carefully conducted and thorough examinations will be required of candidates. The aim will be to avoid unduly exacting standards above present facilities for study and practice in anesthesiology and on the other hand to prevent laxity, which would nullify the main purpose of the certificate. Thus the type of the examination will depend on a careful review of the work done years of practice, special courses of study, and professional standing of the applicant

Written examinations will cover such topics as anatomy, biochemistry, physiology, pharmacology, pathology, physical diagnosis, therapeutics, clinical practice, and public health in relation to anesthesiology

Oral examinations will cover topics in the foregoing list, especially as to their clinical application and such questions on physics and mechanics as are important in anesthesiology, especially dealing with electrical theories and the proper handling of high pressure gases and flammable agents

Practical demonstrations will be required of the management of the candidate's clinical practice in his local surroundings. This may include inspection of clinical records, records of departmental activities, library facilities, available apparatus, and demonstrations of application of anesthetic agents, methods and all techniques included in anesthesiology

## GRADES

A candidate must receive a passing average for each part to be entitled to certification. No candidate shall pass a part who does not receive a grade of 60 per cent or more in each subject of such part. An average grade of 75 per cent shall be required for passing

A candidate who fails in his examination in Part I will have his papers reviewed by the entire board and will be entitled to reexamination at yearly intervals for two consecutive years without further payment of fee. The board may, however, for sufficient reason, deny a candidate the privilege of reexamination

Applicants who fail to exercise the examination privilege within three (3) years of the date of filing the application are required to file a new application and pay a new application fee

## FEES

The fee shall be \$75. Twenty-five dollars shall be paid on filing the application (of which sum \$15 will be returned if the candidate is not accepted for examination) and the remaining \$60 shall be paid before taking the examinations

This board is a nonprofit organization, all fees to be used to extend the existing facilities for training in anesthesiology,

after deducting necessary expenses for maintenance of the office and the conducting of examinations. The board reserves the right to increase the fee when found necessary

## REVOCATION OF CERTIFICATE

All certificates issued by the board shall be subject to revocation by the board at any time, in case it shall determine in its sole judgment that a candidate who has received a certificate either was not properly qualified to receive it or has become disqualified since its receipt

## ADDITIONAL INFORMATION

Every candidate applying for certification must personally appear before the board before being certified

Application blanks must be made on special blanks which may be procured from the Secretary of the American Board of Anesthesiology. They must be completely and accurately filled out accompanied by the other required credentials, and filed with the secretary of the board at least ninety days prior to the date of examination

The Council cannot make any eligibility rulings. These are made only by the Committee on Preliminary Examinations and the Committee on Requirements and Credentials after reviewing the candidate's formal application. Applications cannot be considered for classification and action by these committees unless accompanied by an application fee of \$25.00, \$10.00 of which is not returnable

Application blanks contain the following statement

I hereby make application to the American Board of Anesthesiology, Inc. for the issuance to me of a Certificate of Qualification as a Specialist in Anesthesiology and for examination relative thereto all in accordance with and subject to its rules and regulations and enclose fee of seventy-five dollars (\$75.00). I agree to disqualification from examination or from the issuance of a Certificate of Qualification or to surrender of such certificate as directed by the board in the event that any of the statements hereinafter made by me are false or in the event that any of the rules governing such examinations are violated by me or in the event that I did not comply with or shall violate any of the provisions of the Certificate of Incorporation or Constitution and By-Laws<sup>2</sup> of the American Board of Anesthesiology, Inc. or both, as then constituted. I agree to hold the American Board of Anesthesiology, Inc., its members, examiners, officers and agents free from any damage or complaint by reason of any action they or any of them, may take in connection with this application, such examinations, the grade or grades given with respect to any examination, or the failure of said board or corporation to issue to me such Certification of Qualification"

Proper forms for making application and other information will be furnished by the secretary-treasurer

## AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY

HOWARD FOX, President, New York  
FREDERICK D. WEIDMAN, Vice President, Philadelphia  
C. GUY LANE, Secretary-Treasurer, 416 Marlboro Street, Boston  
CHARLES C. DENNIE, Kansas City, Mo.  
JOSEPH GARDNER HOPKINS, New York  
HENRY E. MICHELSON, Minneapolis  
PAUL A. O'LEARY, Rochester, Minn.  
FRANCIS E. SENEAR, Chicago  
JESSIE BEDFORD SHELWIRE, Dallas, Texas

## ORGANIZATION

At the 1931 meeting of the American Dermatological Association, a committee was appointed to determine the advisability of forming an American board for the certification of competent practitioners in this specialty similar to boards created by the ophthalmologists, the otolaryngologists and by the obstetricians and gynecologists. A similar committee was appointed by the Section on Dermatology and Syphilology of the American Medical Association at its meeting in the same year. A favorable report was rendered by each committee at the 1932 meeting of each of the above organizations

The American Dermatological Association voted to accept the report of this committee, and the president appointed the fol-

1 This may be paid as follows: \$25 with application (\$10 registration fee not returnable) and \$50 before examination

2 Ignorance of the provisions of the Certificate of Incorporation and of the Constitution and By-Laws is not considered by the board to be a valid excuse for violations

lowing four members to represent the association on the newly formed American Board of Dermatology and Syphilology

Dr Jay F Schamberg, Philadelphia  
Dr Howard Fox, New York  
Dr Harold N Cole, Cleveland  
Dr Arthur W Stillians, Chicago

The Section on Dermatology and Syphilology of the American Medical Association also accepted the report of its committee and the chairman appointed the following members to serve as its representatives

Dr Howard Morrow, San Francisco  
Dr William H Mook, St Louis  
Dr George M MacKee, New York  
Dr C Guy Lane, Boston

The first meeting of the board was held in New Orleans on May 11, 1932, at which time officers were elected. At another meeting held on Nov 11, 1932, in Philadelphia the organization was completed and resolutions were adopted concerning the proper procedure to be followed by the board. On Nov 29, 1932, the board was incorporated under the laws of the state of Delaware.

In 1937 the American Academy of Dermatology and Syphilology was formed, and in November 1939 a plan was finally approved whereby the board would be composed of three representatives from each national dermatologic society, viz, the American Dermatological Association, the Section on Dermatology and Syphilology of the American Medical Association, and the American Academy of Dermatology and Syphilology.

These representatives are the members of the board. *Diplomat* refers to a physician who fulfils the requirements of the board and is awarded a certificate.

#### PURPOSES

The board has been established primarily to determine the competence of physicians who specialize in dermatology and syphilology. It will therefore establish minimum standards of education and training, examine applicants and certify properly qualified specialists in this field, prepare lists of those qualified and arrange for the publication of such lists. Because of its interest also in the fulfillment of these standards, it will attempt to stimulate the development of adequate training facilities, investigate institutions and individuals planning to train specialists, and lend its aid to the approval of those institutions and individuals offering adequate training in the specialty. The board, in addition, will always be glad to advise physicians desiring to enter this special field of medicine.

#### REQUIREMENTS FOR CERTIFICATION

##### I General Requirements

- 1 High ethical and professional standing
- 2 Graduation from a medical school recognized by the Council on Medical Education and Hospitals of the American Medical Association
- 3 Satisfactory completion of an internship of not less than one year in a hospital approved by the same Council
- 4 A license to practice medicine
- 5 Membership in the American Medical Association or membership in a similar society recognized as having the same purpose as the American Medical Association
- 6 Citizenship in the United States or citizenship—meaning native citizens—in Canada and Cuba

##### II Special Requirements

Applicants for certification by the board are classed in two groups as follows

Group A consists of physicians who have limited their practice mainly to dermatology and syphilology for ten or more years, including a period of training satisfactory to the board. This group will, in all probability, be abolished in 1949.

Group B consists of physicians who have practiced dermatology and syphilology at least five years, including their period of training. For such physicians who will be examined up to Jan 1, 1945, the board will require two years of full-time planned training in clinical dermatology including adequate instruction in the following subjects as related to the skin: histopathology, mycology, allergy and physics of physical therapy.

##### III Future Special Requirements

For candidates beginning their training after Jan 1, 1940, who will appear for examination subsequent to Jan 1, 1945, additional requirements are effective in accordance with the

program recommended to the various specialty boards by the Advisory Board for Medical Specialties. These minimum requirements of special training for admission to examination are as follows:

1 A period of study, after the internship, of not less than three years in clinics, dispensaries, hospitals or laboratories recognized by the Council on Medical Education and Hospitals of the American Medical Association and approved by the American Board of Dermatology and Syphilology as competent to provide a satisfactory training in dermatology and syphilology. This period of specialized training shall include:

(a) Graduate training in the basic medical sciences which are necessary for the proper understanding and treatment involved in this specialty.

Instruction in the following fundamental subjects as related to the skin is deemed advisable by the board: embryology, histology, chemistry, physiology, bacteriology, mycology, parasitology, pathology, immunology, serology, pharmacology and materia medica, and physics of physical therapy.

(b) An active experience of not less than eighteen months in hospitals, clinics, dispensaries or diagnostic laboratories recognized by the same Council and approved by the American Board of Dermatology and Syphilology as competent to provide an adequate preparation.

(c) Examinations, written and oral, in the clinical, laboratory and public health aspects of dermatology and syphilology.

2 An additional period of not less than two years of study and/or practice.

Therefore, for certification by this board, candidates beginning their training after Jan 1, 1940 must plan for a three years course of systematic training.

#### APPLICATION AND FEE

The board desires to appraise the candidate's educational opportunities (premedical, medical and dermatologic), the character of the men under whom he has worked, his hospital and teaching positions, original investigations, contributions to dermatologic literature, membership in medical societies and local and general reputation.

For this purpose, application must be made on a special blank, which may be obtained from the secretary. No application will be considered unless made on the regular application blank. Applications should be filed early in order to obtain full advantage of the sets of histopathological slides which are available through the Army Medical Museum in Washington. The completed application should be sent, at least two months before the date of examination, to the secretary of the board, together with the required reprints, photographs and the fee of \$50. This fee will not be returned, and no application will be considered until the fee is received. This fee has been carefully computed and is used entirely for administrative purposes. Members of the board do not receive any compensation except for actual expenses connected with holding the examinations.

Make checks payable to American Board of Dermatology and Syphilology, Inc.

#### EXAMINATIONS

Applicants classified in group B will be required to pass a written examination. This written examination on clinical and laboratory subjects including cutaneous pathology will be held simultaneously at stated intervals in different parts of the country, approximately two months before the oral examination.

Applicants classified in either Group A or Group B will be required to pass an oral, clinical and laboratory examination. This examination will be conducted in a clinic or hospital ward where individual cases will be discussed with each candidate as well as various subjects related to the skin such as histopathology, mycology, allergy and physics of physical therapy. The board reserves the right to add to this list other subjects within the field of dermatology and syphilology.

Any candidate for a certificate may take the written examination at the next regular examination of the board after he has completed three full years of training in the specialty.

Examinations are designed to test the candidate's fitness to practice dermatology and syphilology as a specialty. The board will try especially to ascertain the breadth of his clinical experience, his knowledge of recent literature of dermatology and syphilology and his general qualifications as a specialist in this branch of medicine.

Whenever an applicant fails to pass the examination, the board, if requested, will make suggestions as to suitable courses of instruction for the purpose of overcoming deficiencies in the applicant's knowledge of the specialty.

Except in special circumstances applicants shall take the examination within the year following the filing of application and file deposit of fee.

The oral examination will be held near the time and place of the annual meeting of the American Academy of Dermatology and Syphilology. This examination will be held only at the time of regular meetings of the boards.

#### EXAMINATIONS

If the candidate fails or is 'conditioned' in an examination he will be admitted to a second examination after one year but with a three year, and must give sixty days notice of his intention to appear for reexamination. If a candidate who has failed or has been conditioned does not appear for reexamination before the expiration of three years he will be required to make a new application and pay an additional fee of \$35 before reexamination.

A candidate having failed twice must file a new application and pay an additional fee of \$35.

#### CERTIFICATES

A certificate will be issued to each candidate who meets the requirements of the board to the effect that the holder of the certificate has had adequate training in dermatology and syphilology and has successfully fulfilled the requirements of the board.

It is expected that medical schools, hospitals and physicians, as well as the lay public will utilize the certificate from this board as a proof of adequate preparation in the field of dermatology and syphilology and of fitness of candidates for positions under their control. For this purpose lists of those holding certificates from the board will be available for inspection and will be published from time to time in the Directory of Medical Specialists. Diplomates will be identified in the Directory of the American Medical Association.

A certificate granted by this board does not of itself confer or purport to confer, any degree, or legal qualifications, privileges, or license to practice dermatology or syphilology. The board does not intend to limit or interfere with the professional activity of any duly licensed physician. Its aim is to improve the standards of practice of dermatology and syphilology by encouraging improvement in the opportunities for and quality of training for specialists in this field of medicine and to certify, as specialists those who voluntarily comply with the requirements of the board.

Upon the board rests the responsibility of determining the standards or knowledge to be acquired while upon the candidate will always rest the responsibility of acquiring the knowledge to fulfill these standards.

Certificates will be issued only to physicians in the United States, and its possessions, in Canada and in Cuba.

#### REVOCAION OF CERTIFICATES

The certificates issued by the board are issued subject to the provisions of the certificate of incorporation and of the by laws, and each certificate is subject to revocation in the event that (a) the issuance of such certificate or its receipt by the physician so certified shall have been contrary to any of the provisions of the certificate of incorporation or by-laws or (b) the physician so certified shall not have been eligible to receive such certificate irrespective of whether or not the facts constituting him so ineligible were known to or could have been ascertained by the directors of the board at the time of the issuance of such certificate, or (c) the physician so certified shall have made any misstatement of fact in his application for such certificate or in any other statement or representation to the board or its representatives, or (d) the physician so certified shall have been convicted by a court of competent jurisdiction of a felony or of any misdemeanor involving, in the opinion of the board of directors, moral turpitude in connection with his practice of medicine, or (e) the physician so certified shall have had his license to practice medicine revoked or shall have been disciplined or censured as a physician by any court or other body having proper jurisdiction and authority.

#### TRAINING FACILITIES

Institutions in which the graduate training facilities for the full three-year training program in dermatology and syphilology have been approved by the American Board of Dermatology and Syphilology and the Council on Medical Education and Hospitals of the American Medical Association

#### CREDIT FOR MILITARY SERVICE

(1) If a candidate is called into active military or naval service he will receive full credit for dermatological training

already finished at that time, (2) the extent to which medical service in the army or navy will count towards the required training in dermatology and syphilology will be decided in each case upon evidence submitted by the candidate, (3) the board will accept not more than one year of military or naval medical service as part of the required two years' experience in dermatology and syphilology to be eligible for examination, (4) a candidate who is called into military or naval service after completion of three years of training in dermatology and syphilology may take the complete examination of the board, and that if this examination is satisfactory a certificate will be issued after satisfactory completion of two years of further approved experience in dermatology and syphilology.

#### PUBLICATIONS OF THE BOARD

1 Pocket of Information

2 Opportunities for Graduate and Postgraduate Students in Dermatology and Syphilology, containing a list of places where instruction may be obtained and details about these places (In preparation)

3 The complete register of diplomates is published in the Directory of Medical Specialists, which can be obtained from the Columbia University Press New York City \$7.00

4 Syllabus of graduate training

(a) To inform the student physician, intending to specialize, of the field to be covered in his preparation and the methods by which his preparation can be accomplished

(b) To aid the medical schools and the dermatologic department of medical schools and hospitals by outlining the scope of teaching deemed advisable for specialization in dermatology and syphilology

Further information may be obtained from the secretary-treasurer

#### INSTRUCTIONS TO APPLICANTS

Fill out application blank in detail

Enclose fee of \$50 (Make check payable to the American Board of Dermatology and Syphilology, Inc.)

Include photographs as directed on application blank

Enclose reprint of each published paper, if possible

Send completed applications and above items to the secretary

Please indicate under No 13 on the application blank as complete data as possible about your training in dermatology and syphilis. Indicate the month and year, if possible, or at least the number of months of the various parts of your training and also whether full time or part time. If part time indicate whether one-half day, six days a week or three days a week, etc. If dispensary service is considered as part of your training, please indicate details here as well as under No 14.

In No 16 indicate clearly when you limited your practice to dermatology and syphilis.

If your training and your practice overlap, please explain under No 19.

#### AMERICAN BOARD OF INTERNAL MEDICINE, Inc

ERNEST E IRONS Chairman Chicago

REGINALD FITZ Vice Chairman Boston

WILLIAM S MIDDLETON Secretary-Treasurer WILLIAM A

WERRELL, Assistant Secretary-Treasurer, 1301 University Ave, Madison Wis

DAVID P BARR New York

WILLIAM J KERR, San Francisco

WILLIAM S MCCANN, Rochester, N Y

JONATHAN F MEAKINS, Montreal, Quebec

JOHN H MUSSEY, New Orleans

GEORGE GILL RICHARDS, Salt Lake City

"the membership of the board shall be maintained at the ratio of five members from the American College of Physicians and four members from the Section on the Practice of Medicine of the American Medical Association and that at least three of the members of the board from the American College of Physicians and two members of the board from the Section on the Practice of Medicine of the American Medical Association shall be of professorial rank in approved medical schools of the United States or Canada."

"Sec 5, Art 5, Articles of Incorporation"

## HISTORY AND AUTHORITY FOR ORGANIZATION

The American College of Physicians, through its Board of Regents at the annual session in Philadelphia on April 30, 1935, adopted a resolution for the establishment, with the Section on the Practice of Medicine of the American Medical Association, of an "American Board for the Certification of Internists." This board to consist of nine members, six to be appointed by the American College of Physicians, and three by the Section on the Practice of Medicine of the American Medical Association.

At the annual meeting of the American Medical Association at Atlantic City, N J, June 10-14, 1935, the Section on the Practice of Medicine adopted the following resolution: "Resolved, that a committee of three, including a chairman, be appointed by the chairman of the Section on the Practice of Medicine, to discuss with a committee from the American College of Physicians, ways and means by which an examining board, comparable to such boards already existing in certain specialties, may be set up for the purpose of certification of specialists in internal medicine."

President James Alexander Miller of the American College of Physicians appointed the following as representatives of the College on the joint committee: David P Barr, St Louis, Jonathan C Meakins, Montreal, William S Middleton, Madison, John H Musser, New Orleans, O H Perry Pepper, Philadelphia, G Gill Richards, Salt Lake City. William J Kerr, Chairman of the Section on the Practice of Medicine of the American Medical Association, appointed Walter L Bierring, Des Moines, Reginald Fitz, Boston, and Ernest E Irons, Chicago, as representatives of that section. Walter L Bierring was named as chairman of the joint committee.

The joint committee of nine members held its first meeting in Philadelphia Dec 14, 1935. At this meeting a resolution was adopted to submit an application in due form to the Advisory Board for Medical Specialties requesting authority to organize the American Board of Internal Medicine and for admission to membership in the said advisory board. In the preliminary draft of the constitution and by-laws, the ratio of the representation on the board was changed to five members from the American College of Physicians and four members from the Section on the Practice of Medicine of the American Medical Association.

On Feb 16, 1936 a subcommittee consisting of Walter L Bierring, Reginald Fitz, Ernest E Irons, Jonathan C Meakins and William S Middleton held a meeting in the Palmer House, Chicago, to formulate and complete the details of the application to be presented to the executive committee of the Advisory Board for Medical Specialties, which body approved the organization of the American Board of Internal Medicine and directed that articles of incorporation be completed and filed.

In keeping with the ratio of membership to be maintained on the American Board of Internal Medicine, James Alexander Miller, President, officially designated David P Barr, Jonathan C Meakins, William S Middleton, O H Perry Pepper and G Gill Richards as representatives from the American College of Physicians, and William J Kerr, Chairman, designated Walter L Bierring, Reginald Fitz, Ernest E Irons and John H Musser to represent the Section on the Practice of Medicine of the American Medical Association.

The articles of incorporation were filed for record with the county recorder of Polk County at Des Moines, Polk County, Iowa, Feb 28, 1936.

At the annual session of the American College of Physicians, Detroit, March 1-6, 1936, the Board of Regents officially approved the American Board of Internal Medicine. On May 10, 1936 the Advisory Board for Medical Specialties, meeting in Kansas City, gave its final approval to the American Board of Internal Medicine, granting at the same time admission to membership in the Advisory Board for Medical Specialties.

The Council on Medical Education and Hospitals of the American Medical Association approved the board at its meeting May 12, 1936. The Section on the Practice of Medicine of the American Medical Association gave its final approval May 13, 1936. The first meeting of the board was held at the Palmer House, Chicago, June 14-15, 1936.

Subspecialty certification was authorized by the Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association, Feb 16, 1941. The mechanism for instrumenting this program has been perfected through the cooperation of advisory committees in allergy, cardiovascular disease, gastroenterology and tuberculosis.

## PURPOSE

- 1 To improve the standards of practice and the quality of service in the field of internal medicine
- 2 To determine the eligibility of candidates who request admission to examination in accordance with regulations published herein
- 3 To conduct examinations of eligible candidates who seek qualification by this board
- 4 To issue certificates of qualification to all those meeting the requirements of the board
- 5 To aid in improving the educational opportunities for the training of internists
- 6 To administer the regulations which pertain to certification in the medical subspecialties referred to herein

## VALUE OF CERTIFICATION

- 1 Evidence of special training in the broader aspects of the field of internal medicine and recognition of qualifications for the practice of internal medicine as a specialty
- 2 A requirement for admission to Fellowship in the American College of Physicians

## QUALIFICATIONS OF CANDIDATES

Each applicant for admission to the examination shall be required to present evidence that he has met the following standards:

## 1 GENERAL

- A Satisfactory moral and ethical standing in the profession
- B Membership in the American Medical Association or, by courtesy, membership in such Canadian or other medical society or societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association. Except as here provided membership in other societies shall not be required.

## 2 PROFESSIONAL

- A Graduation from a medical school of the United States or Canada approved by the Council on Medical Education and Hospitals of the American Medical Association
- B Completion of an internship of not less than one year in a hospital approved by the same council
- C In the case of an applicant whose training has been received outside of the United States and Canada, his credentials must be satisfactory to the aforementioned council and the Advisory Board for Medical Specialties

## 3 SPECIAL TRAINING

A minimum of five years must elapse after completion of a year of internship in a hospital approved for intern training before the candidate is eligible for admission to an examination.

A Three years of this period must be devoted to special training in internal medicine. This requirement should include a period of at least several months of graduate work under proper supervision in anatomy, physiology, biochemistry, pathology, bacteriology or pharmacology, particularly as related to the practice of internal medicine. This work may be carried on in any domestic or foreign medical school or laboratory recognized by the Council on Medical Education and Hospitals of the American Medical Association as offering appropriate facilities for this type of postgraduate training, or it may include a period of at least two years of graduate work under proper supervision in internal medicine or in its restricted and specialized branches in any domestic or foreign hospital, clinic or dispensary, or under the immediate preceptorship of an internist recognized by the board as offering appropriate facilities for this type of postgraduate experience.

B A period of not less than two years of special practice in the field of internal medicine or in its more restricted and specialized branches.

## MEMORANDUM FOR THE GUIDANCE OF CANDIDATES

The American Board of Internal Medicine does not propose to establish fixed rules for the preliminary training of candidates for certification in this field. Broad general principles for training, however, may be outlined, although such suggestions as are made must of necessity be subject to constant changes reflecting the dynamic nature of the specialty.

1 A sound knowledge of physiology, biochemistry, pharmacology, anatomy, bacteriology and pathology in so far as they apply to disease is essential for continued progress of the individual who practices internal medicine. Such knowledge may be obtained in a number of ways.

A By properly arranged and supervised graduate courses,

B By the opportunities for study afforded by the appointment to a junior position in a department of physiology, biochemistry, pathology, etc. (see above) with attendance upon advanced lectures in the other subjects,

C By advanced study in these subjects while an intern or resident medical officer, and by the application of the principles involved to patients under one's control,

D By the detailed study under supervision of a problem or topic in medicine in which the student brings the basic facts of physiology, pathology, etc., into direct relation with the concrete clinical problem. The analysis of a problem with detailed knowledge of its fundamental pathologic or physiologic background does much to stimulate thoroughness, clear thinking and progress.

2 A portion of the written examination is designed to test the candidate's knowledge in these preclinical subjects and especially in their application to disease rather than their purely laboratory aspects.

3 The mere factual knowledge of medicine and its basic sciences is not sufficient. The candidate must have had training in their use in furthering his understanding in clinical medicine. This implies practical experience under the guidance of older men who bring to their clinical problems ripe knowledge and critical judgment. Preparation to meet this requirement adequately may be even more difficult to obtain than the so-called scientific training. It may, however, be required in the following ways:

A By work in a well organized hospital outdoor clinic conducted by competent physicians.

B By a prolonged period of resident hospital appointments likewise directed by skilled physicians.

C By a period of training in intimate association with a well trained and critical physician who takes the trouble to teach and guide his assistant rather than to expect him only to carry out the minor drudgery of a busy practice.

4 The board does not consider it to the best interests of internal medicine in this country that rigid rules be formulated as to where or how the training outlined above is to be obtained. Medical teaching and knowledge are international. The opportunities of all prospective candidates are not the same. Some may have the opportunity of widening their knowledge by a period of study abroad. Others at the other extreme may be restricted to a comparatively narrow geographic area and their more detailed training must be obtained in short periods of good study scattered over a longer time. Although it is required that at least five years must elapse between the termination of the first intern year and the date when the candidate is eligible to take the examination, a longer period is advisable. The board wishes to emphasize that time and training are but a means to the end of acquiring a broadness and depth of knowledge of internal medicine which the candidate must demonstrate to the board in order to justify it in certifying that he is competent to practice internal medicine as a specialty. The responsibility of acquiring the knowledge as best he may rests with the candidate, while the responsibility of maintaining the standard of knowledge required for certification devolves on the board.

5 Applicants who graduated before the foundation of the American Board of Internal Medicine in 1936 will not be held to the strict interpretation of the published requirements in formal graduate training. Under such circumstances the board will accept the results of the examination as evidence of the qualifications for certification.

6 The board will recognize one year of basic science training which leads to a *higher degree* in the basic sciences, as one year of formal graduate training whether taken previous to or subsequent to the first year of internship.

7 The board will recognize a second year of internship which is confined strictly to internal medicine as one year of the graduate training period.

8 The board will recognize one year of training in pediatrics, neurology or any medical subspecialty as one year of the graduate training period of three years as published herein.

9 In all instances the board will require a minimum of two years training in internal medicine.

10 In the current emergency the board will allow one year of military service in the United States Army, Navy, or Marine Corps to be applied toward the satisfaction of one year of graduate training, or one year of the practice of the specialty of internal medicine. This ruling admits of a substitution of military or naval service for only one year of the three years of graduate training, or one year of the two years of the practice of internal medicine as outlined in the published qualifications for admission to the examination of this board.

#### METHOD OF EXAMINATION

The examination required of candidates for certification as specialists in internal medicine will comprise Part I (written), and Part II (practical or clinical).

Part I The written examination is to be held simultaneously in different sections of the United States and Canada on the third Monday of February and October of each year. This examination will be divided into a morning and an afternoon session of three hours each, and the two sessions A and B will include the following:

A Questions in applied physiology, anatomy, physiological chemistry, pathology, bacteriology and pharmacology as related to internal medicine as well as the cultural aspects of medicine.

B Questions in general internal medicine.

The location of the written examination is determined by the number of candidates from any given area. In all instances, however, the board will make every effort to meet the convenience of all concerned with a minimum of expense and time.

All candidates must successfully pass the written examination before being admitted to the oral examination.

Part II Candidates successful in the written tests will be eligible for the practical or clinical examination, which will be conducted by the members of the board near the time and place of the annual meeting of the American College of Physicians and of the American Medical Association and at such other times and places as the board may designate. This examination is conducted at the bedside, and each candidate will be assigned one or more patients in the hospital.

#### REEXAMINATIONS

1 Any candidate unsuccessful in the written examination may upon request repeat the examination after a period of two years. No additional fee is required for this examination. Any candidate unsuccessful in a second written examination may upon request repeat the examination after a further period of two years. A fee of \$10 is required for admission to a third written examination.

2 Any candidate unsuccessful in the oral examination may upon request repeat the examination after a period of one year. The period of one year is construed as the interval between annual meetings of the American College of Physicians or annual meetings of the American Medical Association. No additional fee is required for this examination. Candidates unsuccessful in the second oral examination may, upon request, repeat the examination after a period of two more years. A fee of \$10 is required for admission to the third oral examination.

#### APPLICATION

Candidates for examination shall make their application on a prescribed form which may be obtained from the office of the secretary-treasurer.

The application shall contain a record of the candidate's premedical and medical training as well as of internships, graduate study, hospital or dispensary staff appointments, teaching positions, membership in medical societies, medical papers published and the names of two well known internists to whom the board may refer for professional and character reference.

The application shall also be accompanied by one recent signed photograph mounted on the application, and the registration and examination fee of \$40, which fee will cover both the written and practical examinations. An additional fee of \$10 will be required when the certificate is issued.

#### CERTIFICATES

The certificate issued by the American Board of Internal Medicine shall be in such form as to comply with the articles of incorporation and the by-laws and shall be signed by the officers and members of the board, and shall bear the official seal of the board.

Certificates of the board will be issued to candidates who have satisfactorily completed the written and practical examinations and been found qualified by the board to practice the specialty of internal medicine.

Subspecialty certification will be designated on the certificate.

#### CERTIFICATION IN MEDICAL SUBSPECIALTIES

In association with the advisory committees in allergy, cardiovascular disease, gastroenterology and tuberculosis, the American Board of Internal Medicine will

1 Certify without examination candidates who have been certified by this board and who have been recommended by the advisory committee of the sub-specialty concerned for certification without examination.

2 Admit to further examination and certify if qualified, candidates who have been certified by this board and who have been recommended by the advisory committee of the sub-specialty concerned as eligible for admission to the examination

3 Examinations for certification in the sub-specialties indicated will be conducted by guest examiners, nominated by the advisory committee concerned and selected by the American Board of Internal Medicine, at the time and place of the regular board examinations. A fee of \$10 is required to meet the expense of this examination

4 Candidates who have not been certified by the American Board of Internal Medicine are ineligible for admission to examination in any sub-specialty

The American Board of Internal Medicine and members of advisory committees in the sub-specialties referred to herein, recognize the value of a broad general training in internal medicine before attempting to qualify in a sub-specialty of medicine. It is, therefore, agreed that all candidates shall first be certified by the American Board of Internal Medicine as a prerequisite for certification in a sub-specialty

#### REVOCATION OF CERTIFICATES

The American Board of Internal Medicine shall have the sole power, jurisdiction and right to determine and decide whether or not the evidence or information placed before it is sufficient to constitute grounds for revocation of any certificate issued by this board, and the decision of the board in the premises shall be final

All official correspondence should be addressed to the secretary-treasurer

#### ORGANIZATION

Recognizing the need for detailed training and special qualifications for the practice of neurological surgery, representatives of both the Society of Neurological Surgeons and the Harvey Cushing Society held an informal meeting in Chicago on March 27, 1939, to consider the advisability of the formation of a national certification board. Later the group was enlarged by representatives from the Section on Nervous and Mental Diseases of the American Medical Association, the Section on Surgery of the American Medical Association, the American Neurological Association, and the American College of Surgeons. Approval of the board by the Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association was given. The American Board of Neurological Surgery was incorporated in the State of Delaware on Aug 1, 1940

The membership of the corporation was nominated as follows: five from the Society of Neurological Surgeons, three from the Harvey Cushing Society, one each from the American College of Surgeons, the Section on Nervous and Mental Disease of the American Medical Association, the Section on Surgery of the American Medical Association, and the American Neurological Association

#### PURPOSES

A To encourage the study, improve the practice, elevate the standards and advance the science of neurological surgery and thereby to serve the cause of public health

B To grant and issue to physicians duly licensed by law, certificates or other recognition of special knowledge in neurological surgery and to suspend and revoke the same

C Certificates granted or issued by the corporation shall not confer or purport to confer on any person any legal qualification, privilege or license to practice neurological surgery,

nor purport to be issued under or in pursuance to or by virtue of any statutory or governmental sanction or authority

D To determine by examination, investigation and otherwise the fitness and competence of specialists in neurological surgery who shall apply for certificates and to prepare, provide, control and conduct examinations, written, oral and otherwise, for such purpose and to determine the results of such examination

E To furnish to the public, hospitals, medical schools, medical societies and practitioners of medicine and surgery lists of neurological surgeons who from time to time have been granted certificates by this corporation

#### GENERAL REQUIREMENTS

##### A General qualifications

1 Satisfactory moral and ethical standing in the profession

2 License to practice medicine

3 Membership in the American Medical Association or, by courtesy, membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association

4 That the surgical activity of the applicant shall be limited to neurological surgery

##### B Professional education

1 Graduation from a medical school of the United States or Canada recognized by the Council on Medical Education and Hospitals of the American Medical Association, or graduation from a foreign school which is acceptable to the American Board of Neurological Surgery, Inc

##### C Special training, to be effective Jan 1, 1940

1 Completion of a surgical internship of not less than one year in a hospital approved by the Council on Medical Education and Hospitals of the American Medical Association, or its equivalent in the opinion of the board

2 A period of graduate study in a recognized graduate school of medicine of not less than three years beyond the intern year, or in an approved hospital or under a sponsorship acceptable to the American Board of Neurological Surgery, Inc, for the training of neurological surgeons. This period of special training shall be of such a character that the relation of the basic sciences of anatomy, physiology, pathology, bacteriology and biochemistry is emphasized. Knowledge of these sciences as applied to the practice of neurological surgery will be required in the examination

3 An additional period of not less than two years in the practice of neurological surgery

##### D Certification without examination

1 On invitation by the board and written application made within two years from Jan 1, 1940, the following may be accepted as eligible for certification upon approval of the board of directors and on the production of evidence of satisfactory moral and ethical standing in the profession

(a) Individuals of professorial rank in approved medical schools of the United States or Canada whose surgical practice is limited to neurological surgery

(b) Those who have specialized in neurological surgery for ten years prior to Jan 1, 1940

#### APPLICATION BLANK AND FEE

Application must be made on the special form which may be procured from the secretary. The application and examination fee for candidates is \$75 whether certified with or without examination. The completed application form should be returned to the secretary accompanied by an application fee of \$25. When notified by the secretary that he is eligible for examination he shall send the examination fee of \$50 to the secretary-treasurer at least two weeks before the date of examination. The application fee will be returned if the candidate is not accepted by the board for examination

A candidate who has failed in one examination is eligible to reexamination in the subject, or subjects, in which he failed, within three years, on payment of a reexamination fee of \$10. A candidate who has failed in one examination and who does not apply for reexamination within three years or a person who has applied within that time but who has failed a second time will be considered a new applicant

#### EXAMINATIONS

Examinations will be held in the spring and fall of each year at or near the time and place of a national meeting at the discretion of the board. Examinations will be oral and based upon broad principles of neurological surgery. The subject

matter of the examination will be divided into six parts (1) neuroanatomy and neurophysiology, (2) neuropathology and bacteriology (3) ophthalmology and x-ray diagnosis (4) neuro-surgical problems, (5) organic neurology and (6) general surgery

All communications should be addressed to the secretary-treasurer

## AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY, Inc

WALTER T DAMBRECHER President New York  
JOSEPH L BACR Vice President, Chicago  
LOUIS E PHINNEY Vice President, Boston  
PAUL TITUS, Secretary-Treasurer, 1015 Highland Bldg., Pittsburgh  
E A SCHUMANN, Philadelphia  
L A EMER, San Francisco  
NORMAN F MILLER, Ann Arbor, Mich  
WILLARD R COOK, Galveston Texas  
F BAIRD CARTER, Durham N C

### ORGANIZATION

In 1930 the American Association of Obstetricians Gynecologists and Abdominal Surgeons, the American Gynecological Society and the Section on Obstetrics and Gynecology of the American Medical Association, each elected three Fellows to constitute the American Board of Obstetrics and Gynecology

Dr Walter T Dambrecht of New York, Dr Paul Titus of Pittsburgh and Dr Grandison D Rowson of St Louis were appointed to represent the American Association of Obstetricians Gynecologists and Abdominal Surgeons, Dr Jennings C Litzberg of Minneapolis, Dr Joseph L Bacr of Chicago and Dr E A Schumann of Philadelphia were appointed to represent the American Gynecological Society, Dr Fred L Adair of Chicago, Dr R D Muesey of Rochester, Minn and Dr E D Plase of Iowa City were appointed to represent the Section on Obstetrics and Gynecology of the American Medical Association. Since formation of the board several of the original members have resigned and others have been duly appointed to fill their places

The board was incorporated and organized and held its first meeting in September 1930. At that time the By-Laws were adopted and provision was made by resolutions for its proper functioning

This board had been in the process of organization since 1927 and put into action a determined effort on the part of these three national organizations to improve the standards of practice of obstetrics and gynecology

### PURPOSES

First. To elevate the standards and advance the cause of obstetrics and gynecology

Second. To determine the competence of practitioners professing to be specialists in obstetrics and gynecology

Third. To arrange, control and conduct examinations to test the qualifications of voluntary candidates appearing before the board for certification as specialists in obstetrics and gynecology

Fourth. To grant and issue certificates of qualification as specialists in the field of obstetrics and gynecology to candidates successful in demonstrating their proficiency

Fifth. To serve the public hospitals and the medical schools by preparing lists of specialists certified by the board

These activities proceed from the certificate of incorporation in which it is stated that "the nature of the business and the objects or purposes proposed to be transacted, promoted and carried on by it" are as follows

To encourage the study, improve the practice, and advance the cause of obstetrics and gynecology, subjects which should be inseparably interwoven, and to grant and to issue to physicians duly licensed by law, certificates or other equivalent recognition of special knowledge in obstetrics and gynecology

### NO DEGREES OR LEGAL RESTRICTIONS

Each certificate granted or issued does not of itself confer or purport to confer upon any person any degree or legal qualifications, privileges or license to practice obstetrics or gynecology, nor does the board intend in any way to interfere with or limit the professional activities of any duly licensed physician. Its chief aim is to standardize qualification for specialists in obstetrics and gynecology, and to certify as specialists those who voluntarily appear before the board for such recognition and certification, according to its regulations and requirements

### VALUE OF CERTIFICATE

The national obstetrical and gynecological organizations, which have participated in the formation of the board and are sponsoring its activities, as well as other societies, attach considerable importance to its certificate. Both the medical and the lay public including hospital directors, have come to utilize the certificate from this board freely as a means of determining who are well grounded as specialists in obstetrics and gynecology

Lists of those holding certificates from this board who are limiting their practice to obstetrics and gynecology are published in the Directory of Medical Specialists, similar lists are published by the *American Journal of Obstetrics and Gynecology* and also appear in the *American Medical Directory*. This latter indicates diplomates of this and other boards by means of numerical symbols appearing in the biographic records but does not give such special recognition to diplomates who are not members of the American Medical Association

A joint directory of specialists certified by the fifteen major special boards was published in 1940 by the Advisory Board for Medical Specialties, a second edition appeared in February 1942 and a third is planned for publication in 1944. This board holds active membership in the Advisory Board for Medical Specialties

This board in cooperation with the Council on Medical Education and Hospitals of the American Medical Association, is conducting a survey of institutions providing acceptable residencies and internships in obstetrics and gynecology

### PREREQUISITES TO ELIGIBILITY

Each applicant before he shall become eligible to receive such certificate or other evidence of recognition

1. Must have had conferred upon him a degree in medicine by an institution of learning approved by the Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association

2. Must establish in a manner satisfactory to the board of directors that he is a physician duly licensed to practice medicine

a. That he is of high ethical and professional standing  
b. That he has received adequate training in obstetrics and gynecology as a specialty

Each candidate should have certain fundamental knowledge of the basic essentials of anatomy, pathology, bacteriology, physiology, pharmacology, and therapeutics as related to the practice of obstetrics and gynecology. Clinical training should consist subsequent to graduation, of at least one year's general rotating internship, and thereafter a special residency in obstetrics and gynecology for a period of at least three (3) years, not necessarily consecutive. The board accepts the fifth or "intern" medical school year required at some schools in lieu of the usual fifth or intern "clinical training" year following graduation. As a substitute for special training, service with a qualified obstetrician-gynecologist preceptor, preferably one who has been certified by the board, may be acceptable. The exact time basis for this has not been specified, and each case must be reviewed and decided individually by the credentials committee after the application is submitted in the regular manner. The time allowance for this type of training will vary with the amount of work done with the preceptor. Opportunity for personal responsibility during this period of training is highly desirable. At least a fundamental knowledge of both obstetrics and gynecology is essential regardless of whether a candidate's practice is limited to one or the other branch. As heretofore, all candidates will be required to stand examination in both branches of the specialty, regardless of the fact that the major part of their practice may be in one or the other branch of the specialty

An applicant entering military service in the present national emergency and assigned to work in general surgery under conditions satisfactory to the credentials committee may receive credit toward the required special training up to a maximum of six (6) months, applicable toward his three years of special training. Emergency military service may be counted as years of practice

3. Must make application for investigation of his credentials and a survey of his character

4. Must assure the board that he is limiting his practice to obstetrics and/or gynecology and that he intends to continue to do so having limited for at least six (6) months before making application

This board deprecates engagement in other fields of practice than that in which candidates profess to be specialists. The

board does not exclude from examination, however, obstetricians or gynecologists who practice abdominal surgery and urology in the female, as well as breast surgery, because of the correlation of these activities.

Emergency military service or any other similar patriotic service, such as work with Selective Service Boards, will not be construed as nonlimitation of practice in violation of the board regulations. Proof of this necessity must be shown.

The board has ruled that physicians who accept male patients in their private or other practice, for operative or other care, cannot be regarded as specialists in obstetrics and gynecology. Special certifying boards in general surgery and internal medicine have been organized and such individuals should apply to one of these boards.

5 Must have membership in the American Medical Association, or membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association.

6 This board will no longer accept applicants for examination who are not full citizens of the United States or of Canada, though they be residents of either country. Applicants must have been certified by either the National Board of Medical Examiners or licensed to practice medicine in the United States or Canada by a state or provincial board of licensure. Notarized statements, *not* citizenship papers, must be furnished when the application is filed, attesting to the fact of full citizenship in the United States or Canada, if the applicant is foreign born.

Further, there will be required a probationary period of at least three (3) years from the date of licensure in the practice of medicine in these countries before such a candidate may be admitted to examination.

#### APPLICATION AND FEES

Application must be made on a special blank which will be furnished by the secretary's office, 1015 Highland Building, Pittsburgh, Pa., and must be forwarded with the other required credentials and the application fee to the secretary's office. The secretary cannot make any eligibility rulings. These are made only by the credentials committee after reviewing the candidate's formal application, which must be completely filled out and previously filed with the secretary.

Application fee \$15 00  
Make checks payable to American Board of Obstetrics and Gynecology. Not returnable.

(Applications will not be considered for classification and action by the credentials committee unless accompanied by the application fee.)

Applications and application fees must be in the office of the secretary at least ninety (90) days prior to the scheduled date of the examinations.

Applicants who fail to exercise the examination privilege within three (3) years of the date of filing the application are required to file a new application and to pay a new application fee.

Applicants declared ineligible for admission to examination may reopen their applications within one (1) year of the filing date without payment of an additional application fee.

Examination fee \$85 00

(Payable when the candidate is notified of acceptance for examination. Not returnable after the candidate has been officially accepted by the credentials committee and notified to report for examination, except if the candidate is prevented from appearing for examination because of induction into military service.)

Total fee \$100 00

The fees have been carefully computed on a basis of cost of examinations and are used entirely for administrative expenses. Examiners serve without compensation other than actual expenses.

All candidates must comply with board regulations in effect for the year in which the examination is taken, regardless of when the original application was filed.

#### REQUIREMENTS

The requirements for all candidates are uniform, as follows:

1 Completion of at least one year in a general rotating intern service in a hospital approved by the Council on Medical Education and Hospitals of the American Medical Association.

(A second year general internship is to be considered as one of a candidate's years of practice. No credit will be given

toward special training during a second year general internship.)

2 A minimum of seven (7) years of practice after the intern year, including at least three (3) years of special training in approved institutions, or adequate preceptorship training in approved institutions or by approved individuals in obstetrics and gynecology satisfactory to the Board of Directors.

3 Limitation of practice to obstetrics and/or gynecology. The candidate's practice must have been so limited for a period of at least six (6) months prior to the date of making application.

4 Membership in the American Medical Association or membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association is required.

5 This board will no longer accept applicants for examination who are not full citizens of the United States or Canada, though they be residents of either country. Foreign born applicants must have been certified by either the National Board of Medical Examiners or licensed to practice medicine in the United States or Canada by a state or provincial board of licensure. Notarized statements, *not* citizenship papers, must be furnished when the application is filed, attesting to the fact of full citizenship in the United States or Canada, if the applicant is foreign born.

(Emergency military service or any other similar patriotic service, such as work with Selective Service boards, etc., will not be construed as nonlimitation of practice in violation of the board regulation. Proof of this necessity must be shown. The same regulations as above, regarding emergency civilian practice, will be allowable for diplomats.)

#### EXAMINATIONS

Applicants not qualifying before the 1942 examinations, as well as those who have previously applied and been accepted for examination but who have failed until this time to appear, will be subject to the new plan of general grouping and uniform examination which went into effect after the final examination in June 1942. Former Group A candidates undergoing reexamination in Part II will not be required to take Part I.

All applicants accepted for examination will be required to attain a passing grade in both a written examination and a review of case records (Part I), before becoming eligible for the oral clinical, and pathological examination (Part II).

The next examination is scheduled for Saturday, Feb. 13, 1943. Application on an official application form, for admission to this examination must be filed in the office of the secretary with the application fee of fifteen dollars (\$15) at least ninety (90) days prior to this date. Grades cannot be mailed from the secretary's office until about April 1, 1943.

Arrangements will be made for candidates to report in any convenient city where there may be a diplomate of this board to conduct or supervise the written examination which will be sent out under sealed cover from the board's office.

Applicants accepted for examination have three years from date of filing to appear for examination. After that time a new application with its fee is required.

Examination consists of

1 A comprehensive written examination, given once yearly, including questions on both obstetrics and gynecology, as evidence of a fundamental knowledge of both branches is required of all candidates.

The filing of a total of twenty-five obstetric and gynecologic case reports, in condensed form. 5 cases may concern major illnesses not necessarily operative.

No candidate is eligible for the general oral clinical, and pathological examinations (Part II) until he has passed the written portion and his case reports have been found satisfactory. The passing grade for the written examination and case reports is 75 per cent, and a candidate whose grade in either or both falls below 75 per cent is conditioned. Either or both of these conditions must be removed before the candidate is eligible for Part II.

Reexamination for the removal of conditions in Part I may be taken at any regular Part I examination after one year but within three years after the first failure, without payment of an additional fee.

Candidates who successfully complete the Part I examination proceed automatically to the Part II examination held later in the year.

The general oral clinical and pathological examinations given all candidates are conducted by the entire board and the assistant examiners near the time and place of the annual meeting of one or more of the national societies represented on this board, usually that of the American Medical Association.

Examination consists of:

1 Oral examination before from two to four examiners. An endeavor is made to adapt the details of the oral examination to each candidate's experience and practice, and the examination is particularly directed to ascertain his familiarity with recent obstetrical and gynecological literature, the breadth of his clinical experience, and his general qualifications as a specialist in obstetrics and gynecology.

2 Pathology examination. The candidate is expected to identify and discuss several obstetrical and gynecological pathological specimens and histologic sections.

As heretofore, all candidates will be required to stand examination in both branches of the specialty regardless of the fact that the major part of their practice may be in one or the other branch of the specialty.

Examiners report orally upon each candidate to the assembled board after which the results of their examinations are considered jointly by the entire board and assistant examiners. After a general consideration of the details of the candidates' oral and pathology examinations including a review of his capability and general adaptability, the candidate is passed or failed by the entire board. No conditions are given in Part II of the examination. When a candidate fails in Part II of the examination, he is not required to repeat Part I but to take a reexamination in the oral clinical and pathological portions only. Reexamination may be taken within three (3) years of the original examination or first failure without payment of an additional fee.

Candidates may be reexamined as often as they desire on satisfactory evidence of adequate additional preparation and payment of reexamination fee. A minimum of one year must elapse between examinations. The board may, at its discretion, deny the candidate the privilege of reexamination.

Candidates must reapply and pay a new fee following a second failure in either part of the board examinations, if they wish to appear again before the board.

#### CASE REPORTS

Case records to be submitted for reexamination will come under the new regulations.

A total of twenty-five obstetric and gynecologic case reports, in condensed form, are required, 5 cases may concern major illnesses, not necessarily operative.

These reports must be of cases treated within four (4) years of the date of the candidate's application. The number of cases from one's residency service should not be more than half the total number.

The group of reports must include a variety of material rather than a number of cases of one type.

These reports should be prepared in condensed form in line with the following items:

1 Hospital admission number and date, with identifying initials, or name, of each patient, and name of operator (candidate), at the top of the page.

2 (a) Preoperative diagnosis, and basis for this, in brief  
(b) Postoperative diagnosis, based on findings.

3 Nature of operation, omitting descriptive technical details, but including pathologist's findings on tissue removed. Obstetric case reports should show:

(a) Date of first antepartum visit and any special features bearing on the case.

(b) The weight and condition of the child at birth and at time of discharge from the hospital.

Obstetric reports which omit measurements of the pelvic inlet and outlet will be considered incomplete.

4 Critical summary or analysis of cases, with critical deductions derived from correctness or incorrectness of diagnosis, operative findings, postoperative course and from final results on discharges from hospital and at six months "follow-up" examination.

5 Two (2) separate index lists must accompany these reports, with verifications of these and of the fact that the candidate was the operator.

*Preparation of Reports.* These are not to be copied verbatim from hospital records, but must be sufficiently complete so that

the examiner can evaluate the judgment of the candidate in his choice of procedure.

Each report must include the items listed above, and amplified below:

1 Including each separate case report must be the hospital number, name of the hospital at which the patient was operated upon with all pertinent dates, together with the candidate's name, or identifiable initials.

2 Histories must be typewritten on standard size paper, 8" by 11 inches.

3 Must be assembled by individual cases.

4 Must not be bound with any form of binding other than light weight paper folders or covers.

The critical summary or analysis which must be prepared for each case must include:

1 An account of the candidate's personal observations of the case both prior to and subsequent to operation.

2 The basis for the diagnosis.

3 The facts that determined the course of treatment. Details of operative technique should not be included.

4 Critical conclusions to be drawn from the outcome of the case.

Case reports which do not include such discussion and comments will not be reviewed or graded by the examiners.

Two separate index lists must be made for each individual hospital at which operations were performed. These must state:

Candidate's name at head of each page.

Name and address of the hospital.

Patient's name or identifiable initials.

Patient's admission number.

Date of admission.

Date of operation.

Date of discharge.

Lists must be verified by the superintendent or by the medical director or each individual hospital from which the reports come. All verifications must be formally signed by the responsible hospital official, attesting in each instance that the candidate was the operator.

Case reports are to be presented with the completed examination paper to the examiner conducting the written examination. They are not to be sent by the candidate to the secretary.

The final action of the board is based upon the candidate's ethical and professional record, training and attainments, as well as on the results of his formal examination.

#### REVOCATION OF CERTIFICATES

Each Certificate of Qualification may be revoked by this board in the event that:

1 Any representation or statement made to the board or to any of its representatives by the physician so certified, including the statements contained in his application for certification, shall have been false or intentionally misleading.

2 The physician so certified shall not *in fact* have been eligible to receive certification, irrespective of whether or not the facts constituting such ineligibility were known to or could have been ascertained by this board, its members, directors, examiners, officers, or agents at or before the time of issuance of such Certificate of Qualification.

3 Any rule governing examination for certification shall have been violated by the physician so certified and the fact of such violation shall not have been ascertained until after the issuance of the Certificate of Qualification.

4 The physician so certified shall fail to abide by the regulations governing the limitation of his practice to the specialty as hereinabove defined.

5 The physician so certified shall violate the standards of ethical practice of medicine then accepted by organized medicine in the locality in which he shall be practicing and, without limitation of the foregoing, the forfeiture, revocation or suspension of his license to practice medicine, or the expulsion from, or suspension from the rights and privileges of membership in, the American Medical Association or any state or county society affiliated therewith, any recognized Canadian medical society, the American Association of Obstetricians and Gynecologists and Abdominal Surgeons or the American Gynecological Society shall be conclusive evidence of a violation of such standards of ethical practice of medicine.

6 The physician so certified shall fail to comply with or violate, or the issuance or receipt by him of such Certificate of Qualification shall have been contrary to or in violation of, the Certificate of Incorporation, the By-Laws or the Rules and Regulations of this board

The board recognizes the shortage of physicians for civilian needs during the war period, and for an indeterminate period thereafter, and will not enforce its existing regulations against nonlimitation of practice among its present holders of certificates, provided it can be justified by military duties and local conditions. Proof of such necessity must be shown.

Upon revocation of any Certificate of Qualification by this board as aforesaid, the holder thereof shall return his Certificate of Qualification and all other evidence of certification to the secretary of the board and his name shall be removed from the list of diplomates or certificate holders by this board.

Make checks payable to the American Board of Obstetrics and Gynecology. Communications should be addressed to the secretary-treasurer.

## AMERICAN BOARD OF OPHTHALMOLOGY

CONRAD BERENS, Chairman, New York

WILLIAM L. BENEDICT, Vice Chairman, Rochester, Minn.

JOHN GREEN, Secretary-Treasurer, 6830 Waterman Avenue, St. Louis

DANIEL B. KIRBY, Assistant Secretary, New York

EDWARD C. ELIETT, Memphis, Tenn.

GRADY E. CLAY, Atlanta, Ga.

WALTER B. LANCASTER, Hanover, N. H.

ALLEN GREENWOOD, Boston

FREDRICK C. CORDES, San Francisco

S. JUDD BEACH, Portland, Maine

GEORGINA M. Dvorak Theobald, Oak Park, Ill.

CECIL S. O'BRIEN, Iowa City

### ORIGIN, AIMS AND METHODS

In 1913 the American Ophthalmological Society, the Section on Ophthalmology of the American Medical Association, and the American Academy of Ophthalmology and Otolaryngology appointed committees to report on ophthalmic education.

In 1914 these committees recommended that medical schools of the first class establish graduate courses in ophthalmology leading to an appropriate degree, and that these courses should represent not less than two years of systematic work subsequent to taking the degree of Doctor of Medicine. There was unanimous agreement as to the need of systematized and standardized training of those who are to practice ophthalmology, but it was clear that, in the near future, the number who would take the complete course leading to such a degree would be small. Moreover, such a course would not solve the problem of differentiating, in some degree, between the competent and the incompetent among those now in practice in ophthalmology. The committees were continued and, in 1915, they made further recommendations, as a result of which a joint board was created consisting of three representatives from each of the three special societies.

In 1916, after much preliminary work, this board was organized as the American Board for Ophthalmic Examinations (later changed to "American Board of Ophthalmology"). It was incorporated May 3, 1917.

In 1934 the plan of organization was changed so that each component society elects four members, instead of three, to form the board. The members of this board are chosen in the same manner as the presiding officers of these societies are chosen. One is elected each year by each of the societies represented on the board, to serve for four years.

As other specialties formed boards similar to the American Board of Ophthalmology the need for some supervising and coordinating control led to action by the American Medical Association in 1933 authorizing the Council on Medical Education and Hospitals (1) to formulate standards of administration, based on those of the American Board of Ophthalmology, of Otolaryngology, of Gynecology and Obstetrics, and of Dermatology and Syphilology, and (2) to recognize officially new boards meeting these standards.

The Constitution of the Advisory Board for Medical Specialties which was organized in 1934 states that "This board shall act in an advisory capacity to such organizations as may seek its advice concerning the coordination of the education and certification of medical specialists."

### CHIEF FUNCTIONS

1 To establish standards of fitness to practice ophthalmology cooperating with hospitals and graduate schools of medicine

2 To arrange and conduct examinations to test the qualifications of those who practice ophthalmology, and to confer certificates upon those who meet the standards established by the board

3 To act as preceptors for prospective students of ophthalmology

### NO DEGREES

The conferring of a degree is left to the universities, where it belongs, and the board makes no attempt to control the practice of ophthalmology by any license or legal regulation whatever. It simply aims to establish a standard of fitness to practice ophthalmology, and to certificate any who, voluntarily, apply and satisfy the board of their qualifications.

The following is the wording of the present certificate

The American Board of Ophthalmology hereby certifies that (name) has pursued an accepted course of graduate study and clinical work, and has successfully passed the examination in ophthalmology conducted under the authority of this Board.

Date

*Signatures of members of the Board*

Many special eye hospitals as well as general hospitals in all parts of the country require the certificate for appointment or promotion on their staffs. In addition, many societies now require the certificate as a prerequisite for membership.

The number of institutions and societies which require the certificate of the board is increasing.

The American College of Surgeons recognizes the certificate of this board as evidence of academic fitness in ophthalmology. It requires from candidates for its Fellowship who hold such certificates only half as many case histories as from those who are not so certificated.

Up to July 1, 1941 approximately 1,875 ophthalmologists have received the certificate of the board.

### FEES

The fee for the examination and the certificate of the American Board of Ophthalmology is \$50. Of this sum \$25, which is not returnable, must accompany the application. The balance of \$25 must be paid before the candidate is admitted to examination.

Applications expire three years from date of application. If a candidate has not appeared for examination before expiration of his application, he will be required to apply again and pay an additional application fee of \$25.

The fees of candidates are used solely for defraying the actual expenses of the board. The members of the board and their associates receive no emoluments.

### GENERAL REQUIREMENTS FOR ALL CANDIDATES

1 Application on special blank, which may be obtained from the secretary, must be filled out accurately. Letters of endorsement from two well known physicians (preferably ophthalmologists) together with any other required credentials must accompany the application and must be sent to the secretary at least before December 1 preceding date when the candidate expects to appear for examination.

2 The candidate must have high ethical and professional standing in his community.

3 Membership in the American Medical Association or such other societies as are recognized for the purpose by the Council on Medical Education and Hospitals of the American Medical Association. In the case of an applicant whose training has been received outside of the United States and Canada, his credentials must be satisfactory to the board, if he has been in practice less than ten years he should obtain the certificate of the National Board of Medical Examiners.

4 A list of papers or books published by the candidate must be submitted.

5 Reports of ten cases of varied character which have been observed and treated by the applicant are required.

6 An examination divided into Part I (oral) and Part II (clinical, practical and laboratory). In both of these examinations a knowledge of the practical application of the basic sciences of ophthalmology will be required.

7 Citizenship in country where candidate practices. The final action of the board is based on the candidate's professional record, training and attainments as well as on the results of his formal examinations.

### GENERAL EDUCATIONAL REQUIREMENTS (Applicable as far as possible after 1944)

1 A degree from a medical school of high standing satisfactory to the board and approved by the Council on Medical Education and Hospitals of the American Medical Association. In the case of an applicant whose training has been received outside of the United States and Canada his credentials must be satisfactory to the board. He may be required to obtain the certificate of the National Board of Medical Examiners.

2 Completion of an internship of not less than one year in a hospital approved by the same Council.

### SPECIAL TRAINING

(Applicable as far as possible after 1944)

A period of combined study, training and practice of not less than three years in approved medical schools, hospitals, clinics, dispensaries, laboratories, preceptorships and private practice.

(A total of five years will be required of candidates practicing eye, ear, nose and throat.)

1 This shall include graduate study of the basic medical sciences which are fundamental to the intelligent practice of ophthalmology, particularly anatomy, histology, embryology, optics, physiologic optics, visual physiology and psychology, pathology, bacteriology, pharmacology. Mere factual knowledge of these subjects is not sufficient. The candidate must have had training in their application and in their use in clinical ophthalmology, especially in refraction disorders of motility and binocular vision, perimetry, and in the slit lamp adjustment and use of instruments such as the ophthalmoscope, retinoscope, slit lamp and microscope.

2 Active clinical experience in approved hospitals, clinics, dispensaries and private practice. Library and laboratory facilities should be utilized for the intensive study of cases.

The subject matter to be covered under 1 and 2 is outlined in the syllabus prepared by the board.

These requirements may be met in various ways.

### BASIC STUDIES

A—By courses in approved graduate medical schools.

B—By the opportunities for study afforded by the appointment to a junior position in one of the departments with attendance at advanced lectures in the other subjects.

C—By advanced study of these subjects while a resident and by application of the principles involved to patients under one's control.

D—By the detailed study, under supervision or as assistant to an experienced research worker, of some problem or topic which brings the basic facts of physiology, pathology, etc. into direct relation with the concrete clinical problem. The analysis of a problem with detailed knowledge of its fundamental physiologic and pathologic background does much to stimulate thoroughness, clear thinking and progress.

### CLINICAL EXPERIENCE

A—By residency in an approved hospital. The most desirable of these residencies have regular lectures covering the whole field of clinical ophthalmology and of the basic subjects as applied in clinical practice. Many of these have seminars at which residents report cases which they have carefully worked up. These are discussed by the other residents and by the staff and the method of presentation as well as the subject matter critically considered.

B—There are many residencies, usually of 12 months which do not furnish regular instruction by lectures and quizzes and seminars. If he has access to a good library and laboratory the student can learn a great deal and has some advantages over the man who expects to be "spoon-fed." The syllabus prepared by the board will guide him in his selection of topics to be studied.

C—There are some opportunities to continue the study and experience by securing appointments as fellows.

D—By a period of training in association with a well trained and critical ophthalmologist who takes the trouble to teach and guide his assistant.

E—After completing a residency it is of great advantage to secure a position in a clinic as fellow or assistant. This may require only part time work, but due credit will be given. Its value to the student depends on how much study he puts into it and on how competent his seniors are.

F—Research under competent critical and sympathetic supervision will give first hand insight into (1) the methods whereby old knowledge was and new knowledge is acquired, and (2) the pitfalls which accompany attempts to enlarge the sphere of knowledge. Only in this way can the candidate evaluate facts

of the past and present in the intelligent critical way which is expected of the specialist.

The candidate who cannot secure the type of residency he desires should not despair, for his progress depends far more on how he uses his opportunities than on the opportunities themselves.

### WHAT CONSTITUTES THE EXAMINATION

In determining the question of certification, the examiners rely on the following criteria:

- 1 The applicant's professional and ethical record,
- 2 Oral examination,
- 3 Clinical, practical, and laboratory examination.

### CASE REPORTS

Detailed instructions for the preparation of case reports should be obtained from the secretary.

### ORAL EXAMINATION PART I

These examinations will be given just prior to the practical and clinical examination.

The oral examination will be on subjects as follows:

|                            |   |
|----------------------------|---|
| External Diseases          | Relation of the Eye to General Diseases                   |
| Pathology-Histopathology   |   |
| Bacteriology               | Therapeutics and Operations (including Practical Surgery) |
| Refraction and Retinoscopy | Optics and Visual Physiology                              |
| Anatomy and Embryology     |   |
| Perimetry and Campimetry   |   |

### PRACTICAL AND CLINICAL EXAMINATION PART II

The purpose of the examination is to determine the competence of the candidate to practice ophthalmology.

Candidates must be prepared to be examined in the whole field covered by the syllabus of the board. The time spent in preparation will count less than the knowledge and experience acquired as shown on examination.

The subdivisions of the practical examination are as follows:

1 External diseases of the eye, lacrimal passages, etc., including inspection, focal illumination, use of loupe and slit lamp, examination of reactions of the pupil, of tension by tonometer and by fingers.

2 Ophthalmoscopy. Several patients will be examined by the candidate and the findings described or drawn. The ability to see with the ophthalmoscope and to interpret what is seen, and the systematic and thorough methods of examination used by the candidate will count for more than mere statement of diagnosis. A candidate should bring his own ophthalmoscope so that he may not suffer the handicap of an unfamiliar instrument.

3 Pathology. The candidate should be familiar with general clinical pathology as well as the etiology, pathology, and bacteriology of diseases of the eye. He will be asked to examine microscopic slides and to recognize ordinary normal and pathologic histology of the eye and to identify the commoner microorganisms.

4 Refraction. A candidate will examine patients and show mastery of various methods, and of the principles of refraction and of retinoscopy. He should bring his own retinoscope.

5 Ocular Motility. The candidate will demonstrate upon patients his familiarity with routine methods of examination for abnormalities of the ocular muscles.

6 Practical Surgery. A candidate will demonstrate his surgical technic upon animals' eyes. To have the advantage of using instruments with which he is familiar, he should bring his own equipment for performing a regular combined extraction of the lens.

### DATES OF EXAMINATION

Examinations will be held annually at or near the time and place of the meeting of the American Medical Association, also at other times and places at the discretion of the board, depending on the number of applications from any region.

Notices of all examinations will be found in The Journal of the American Medical Association, and in the special journals of ophthalmology.

### REEXAMINATION

Candidates may be reexamined as often as they desire, provided they give satisfactory evidence of adequate preparation. One year must elapse between examinations and the board may, at its discretion, deny the candidate the privilege of reexamination.

### REVOCATION OF CERTIFICATE

Any certificate issued by the board shall be subject to revocation by the board at any time in case it shall determine in its sole judgment that a candidate, who has received the certificate

of the American Board of Ophthalmology, either was not properly qualified to receive it, or has since its receipt become disqualified

Communications should be addressed to the secretary-treasurer

## AMERICAN BOARD OF ORTHOPAEDIC SURGERY, Inc

FRI MONT A CHANDLER, President, Chicago

FRANK D DICKSON, Vice President, Kansas City, Mo

GUY A CAIDWILL, Secretary-Treasurer, 3503 Prytania Street, New Orleans

### INTRODUCTION

The rapid growth of specialization and the increasing number of physicians limiting themselves in their practice to one branch of medicine or surgery emphasize the need for the proper certification of specialists in the various branches of the medical science. In recognition of this condition the American Board of Orthopaedic Surgery, Inc, aims to elevate the standard of qualifications for the practice of orthopaedic surgery and to certify those surgeons who voluntarily comply with its requirements.

In order to place orthopaedic surgery on the highest possible plane, the American Orthopaedic Association, the Section on Orthopaedic Surgery of the American Medical Association and the American Academy of Orthopaedic Surgeons united in organizing a certifying board which was incorporated in the year 1934 as the American Board of Orthopaedic Surgery, Inc.

The American Board of Orthopaedic Surgery, Inc, has been officially approved by the Advisory Board for Medical Specialties and by the Council on Medical Education and Hospitals of the American Medical Association.

### WHAT THE BOARD WILL ACCOMPLISH

1 Certification by the board will establish a criterion to both interested lay and professional groups for judging the qualifications of an orthopaedic surgeon. Thus a reliable guide will be furnished for the choosing of consultants.

2 Hospitals and other organizations will no doubt establish rules limiting service on their permanent staffs to those certified by the board.

3 It will gradually tend to limit the practice of orthopaedic surgery to those properly qualified.

4 Certification by the American Board of Orthopaedic Surgery is one of the essential requirements for membership in the American Orthopaedic Association and the American Academy of Orthopaedic Surgeons.

Excerpts from Articles 1, 2, 7 and 8 of the By-Laws

Article 1 *Section 1* DEFINITION Orthopaedic Surgery is that branch of surgery especially concerned with the preservation and restoration of the functions of the skeletal system, its articulations and associated structures.

Article 2 *Section 2* PURPOSES To test and determine the qualifications of applicants for registration and to issue certificates to those found qualified.

*Section 3* To prepare and maintain a registry of the holders of the certificates issued by the board.

*Section 4* To serve the public, physicians, hospitals and medical schools by furnishing lists of those who have received the certificate of the board, and thus to assist in protecting the public against irresponsible and unqualified practitioners who profess to specialize in orthopaedic surgery.

Article 7 *Section 1* APPLICATION FOR CERTIFICATE Each application for a certificate shall be filed with the secretary upon the prescribed form, and shall be accompanied by the fee which the board may fix from time to time. It shall also be accompanied by an unmounted autographed recent photograph of the applicant and the names of two orthopaedic surgeons acceptable to the board, who may be referred to for information in regard to the applicant.

*Section 2* The applicant must have the following qualifications

(a) He must be a graduate of a medical school approved by the Council on Medical Education and Hospitals of the American Medical Association.

(b) He must be of high ethical and professional standing.

(c) He must be a citizen of the United States or Canada.

(d) He must be duly authorized to practice medicine in the state or province of his residence.

(e) He must be a member of the American Medical Association or another society approved by the Council on Medical Education and Hospitals of the American Medical Association.

(f) He must have had one year of internship in a general hospital acceptable to the board.

(g) After Jan 1, 1940, he must have had three years of concentrated instruction in orthopaedic surgery approved by and acceptable to the board. (A residency of at least two years on an orthopaedic service of a hospital recognized by the Council of the American Medical Association is desirable.)

(h) He must have knowledge of the basic medical sciences related to orthopaedic surgery.

(i) He must have had at least two years' further experience in the actual practice of orthopaedic surgery. Continuation of training (g) beyond the three years required will not be considered as actual practice unless the position of the candidate is considered permanent or his responsibilities equivalent to those encountered in private practice. This means that interns, residents, fellows, graduate students and assistants will not be credited with additional periods of training unless they are permanent members of the organizations with which they are associated.

(j) He must have limited his work to the field of orthopaedic surgery for at least two years prior to the submission of his application for examination.

(k) In the case of an applicant whose training has been received outside of the United States and Canada, his credentials must be satisfactory to the Council on Medical Education and Hospitals of the American Medical Association and to the National Board of Medical Examiners. In addition, he must have been engaged in the practice of orthopaedic surgery in the United States (or Canada) for at least three years prior to the submission of his application.

(l) During the present national emergency, the board will recognize up to a maximum of one year for work done in the orthopaedic division of the Army or Navy. If the above fills out the three years of special required training for examination, further time spent in the orthopaedic division of the armed forces, up to a maximum of one year, will be credited towards the practice requirement.

*Section 3* Each applicant shall be examined and his qualifications determined by the board in such manner as it may designate, and his record shall be reviewed by the board in the light of all assembled information.

Article 8 *Section 1* CERTIFICATE If the applicant be found qualified therefor, a certificate that he has been found by this board qualified to practice orthopaedic surgery shall be issued to him. The certificate shall be in such form as may be adopted by the board, and shall be signed by the officers and members of the board.

### EXAMINATION

Examinations will be held once a year. If feasible, these examinations will be in conjunction with meetings of the major orthopaedic societies.

Oral and written examinations will be held on clinical, anatomical and pathological phases of orthopaedic surgery. Anatomical and pathological laboratories and hospital wards will be used when practicable.

### APPLICATION FOR CERTIFICATION

Application forms may be obtained from the secretary of the board. These should be filled in accurately and returned not less than ninety days prior to the next examination. An autographed photograph and the fee must accompany the application.

### FEES

The examination fees have been adjusted so as to be in closer accord with the other specialty boards. A fee of \$50 will accompany the application and cover the expenses of the first examination. Candidates appearing before the board for second and third examinations will pay additional fees of \$25 for each of the subsequent examinations following the first. This will take effect as of Jan 15, 1941 and will not be retroactive.

Communications should be addressed to the secretary.

GEORGE E SHAMBAUGH, Chicago

## ORIGIN, AIMS AND METHODS

### SOURCE OF AUTHORITY

In 1916 the American Academy of Ophthalmology and Otolaryngology appointed a committee on examinations, consisting of Drs Thomas E Carmody, Harris P Mosher and Ross Hall Skillern before whom candidates professing otolaryngology as a specialty were to appear to be qualified as such.

In 1924 through the efforts of Dr George Shambaugh the committee was enlarged to include representatives from each of the following societies: the American Laryngological Association, the American Otolaryngological Society, the American Rhinological and Otolaryngological Society, the American Academy of Ophthalmology and Otolaryngology and the Section of Laryngology, Otolaryngology and Rhinology of the American Medical Association. Each organization appointed two representatives, making a total of ten, which constituted the first American Board of Otolaryngology. The organization members

Dr J C Beck of Chicago, Dr T E Carmody of Denver, Dr T H Halstead of Syracuse, N Y, Dr H W Loeb of St Louis, Dr R C Lynch of New Orleans, Dr H P Mosher of Boston, Dr B R Shurly of Detroit, Dr R H Skillern of Philadelphia, Dr F R Spencer of Boulder, Colo., and Dr W P Wherry of Omaha.

## CHIEF ACTIVITIES OF THE BOARD

First, to establish the qualifications for the practice of otolaryngology and to hold examinations and to certify those otolaryngologists whom the board finds qualified and competent.

Second, these activities proceed from the object of the corporation which is stated in the articles of incorporation to be:

'The object of the corporation shall be to elevate the standard of otolaryngology to familiarize the public with its aims and ideals, to protect the public against irresponsible and unqualified practitioners, to receive applications for examination in otolaryngology, to conduct examinations of applicants, to issue certificates of qualification in otolaryngology and to perform such duties as will advance the cause of otolaryngology.'

## NO DEGREES

It is not the function of the board to grant a degree.

## AIM OF CERTIFICATION

It is the aim of the board that societies representing the specialty of otolaryngology, teaching institutions and hospitals shall require the certificate of the board for admission to the special societies and for advancement in hospitals or teaching institutions.

## CLASSIFICATION OF CANDIDATES

Applicants for examination and for the Certificate of the Board are divided into classes according to the length of time they have practiced otolaryngology.

(Limited practice in otolaryngology interpreted as ninety (90) per cent otolaryngological practice—ophthalmology excepted.)

Class I—Limited Practice, fifteen years or more

Class II—Limited Practice, ten to fifteen years

Class III—Limited Practice, five to ten years

Class IV—Limited Practice, three to five years

(Basic course in otolaryngology and residency in otolaryngology required in this group—Class IV.)

## REQUIREMENTS

The following are required by the board:

First, a candidate acceptable for the examination must be a graduate of a school approved by the Council on Medical Education and Hospitals of the American Medical Association and he must have had at least one year of general internship in an approved hospital.

Second, membership in the American Medical Association or, by courtesy, membership in such Canadian or other medical societies as is recognized by the Council on Medical Education and Hospitals of the American Medical Association. Except as here provided, membership in other societies will not be required.

In rare cases the board may make exceptions to the foregoing.

Third, a candidate must have completed an acceptable basic science course and at least a one year residency in otolaryngology. A two year residency however is recommended. The minimum preparation accepted for examination is three years graduate work.

Fourth, five years specialized practice or its equivalent in the judgment of the board may be accepted in lieu of the requirements in paragraph 3.

Fifth, application must be made on a printed blank procured from the secretary. The executed instrument must be returned to the secretary together with other required credentials at least ninety days in advance of the examination at which the candidate desires to appear.

Sixth, with the application printed verification from the institutions with dates of examination obtained.

Seventh, a recommendation from the local otolaryngological society or societies.

Eighth, a certificate from the central committee of the American Medical Association.

Ninth, a certificate from the local medical association.

Ninth, the fee for the examination is \$50, and check for this amount must accompany the application blank. No application will be acted on until the fee is paid. Under no circumstances is the fee returnable.

Tenth, the application remains valid only five years. An applicant must appear for examination within this time or forfeit the fee.

Eleventh, if the candidate fails in an examination he will be admitted to a second examination after one year, or at any time within the five year limit of his application. Ninety days' notice of intention to appear is required. If a candidate who has failed does not appear before five years after the filing of his application he will be required to make a new application and pay an additional fee of \$50 before the reexamination.

An applicant having failed twice, must file a new application, pay an additional fee of \$50 and convince the board of additional postgraduate study previous to being assigned an appointment for another examination.

Twelfth, examinations covering two or three days will be held biannually at, or near, the time and place of meeting of the American Medical Association, and of the American Academy of Ophthalmology and Otolaryngology.

Thirteenth, candidates are required to sign the following pledge:

I hereby apply to the American Board of Otolaryngology for examination by the said board in accordance with its rules and herewith enclose the fee of \$50. I hereby agree that prior to an examination, or subsequent to my examination, the Board may investigate my standing and reputation as a physician, including my reputation for complying with the standard of ethics of the profession, and may refuse to examine me, or, having examined me, may refuse a certificate, and such refusal to grant a certificate, whether justified or otherwise, may not and shall not be questioned by me in any court of law or equity or other tribunal, nor shall I have any claim, in the event of such refusal, to a return of the fee accompanying this application.

#### PRACTICAL EXAMINATION

The complete examination consists of three or four parts: clinical, didactic, pathology, and possibly written.

All candidates will be examined in both didactic and clinical phases of otolaryngology. In addition to the foregoing:

Written examination may be given at the discretion of the board.

Candidates in Class III take the examination in gross pathology.

Candidates in Class IV take microscopy and gross pathology.

The didactic examination is a private oral examination covering all aspects of otolaryngology.

The clinical examination of patients includes history taking, physical and functional examinations, the use of laboratory and x-ray findings, and a discussion of differential diagnosis.

Communications should be addressed to the secretary, Dr. Dean M. Lierle, 1500 Medical Arts Building, Omaha, Neb.

### AMERICAN BOARD OF PATHOLOGY, Inc

A. H. SANFORD, President, Rochester, Minn.

FREDERICK H. LAMB, Vice President, Davenport, Iowa.

FRANK W. HARTMAN, Secretary-Treasurer, Henry Ford Hospital, Detroit.

ALVIN G. FOORD, Pasadena, Calif.

NATHAN CHANDLER FOOT, New York.

HOWARD T. KARSNER, Cleveland.

ROY R. KRACKE, Emory University, Ga.

JOSIAH J. MOORE, Chicago.

#### ORGANIZATION AND OBJECTIVES

In June 1935 the Section on Pathology and Physiology of the American Medical Association and the American Society of Clinical Pathologists appointed committees which acted jointly in consideration of the feasibility and necessity of a national qualifying board. The joint committees agreed unanimously that such a board should be established and proceeded to draw up by-laws for such a board. In May 1936 the American Society of Clinical Pathologists and the Section on Pathology and Physiology of the American Medical Association accepted the proposed by-laws, authorized the nomination of four members each to the board and suggested incorporation in the state

of Michigan. Approval of the board by the Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association was given. On July 19, 1936, the organization of the board was carried out in Chicago.

#### PURPOSES

A To encourage the study and promote the practice of pathology.

B To elevate the standards and advance the cause of pathology, by encouraging its study and improving its practice.

C To determine the competence of those wishing to practice this specialty of pathology and to arrange, conduct, and control investigations and examinations to determine the qualifications of such individuals who voluntarily apply for the certificates issued by the corporation.

D To grant and issue certificates in the special field of pathology to voluntary applicants therefor and to maintain a registry of holders of such certificates.

E To serve the public, the medical profession, hospitals and medical schools by preparing and furnishing lists of specialists who have been certified by the corporation.

#### VALUE OF THE CERTIFICATE

Judging from the experience of other specialties operating a certifying board it is anticipated that the certificate will be of value in that the medical profession, the lay public, and hospital administrators will utilize certificates from the board as a means of discriminating between those that are thoroughly qualified in pathology and those that are not. Lists of those holding certificates will be made available from time to time by this board through the publication of the same in pamphlets and in national medical journals.

#### BOARD NOT AN EDUCATIONAL INSTITUTION

The board is in no sense an educational institution and the certificates of the board are not to be considered degrees. Therefore the certificate does not confer on any person legal qualifications, privileges, or license to practice medicine or the specialty of pathology. The board does not purport in any way to interfere with or limit the professional activities of any licensed physician. Its chief aim, as stated above, is to standardize the qualifications for the specialty of pathology and to issue certificates to those voluntarily complying with the requirements of the board.

#### GENERAL REQUIREMENTS

A General qualifications.

1 Satisfactory moral and ethical standing in the profession.

2 License to practice medicine.

3 Membership or associate membership in the American Medical Association or by courtesy membership in such Canadian or other national medical societies as are approved by the Council on Medical Education and Hospitals of the American Medical Association is suggested.

4 That the applicant devotes his time primarily and principally to the practice of pathology.

B Professional education.\*

1 Graduation from a medical school in the United States or Canada, approved by the Council on Medical Education and Hospitals of the American Medical Association.

C Special training, to be effective after July 1, 1938.

1 Completion of an internship of not less than one year in a hospital approved by the Council on Medical Education and Hospitals of the American Medical Association.

2 A period of study, exclusive of internship, of not less than three calendar years, exclusive of reasonable vacation periods, in an institution or department of pathology recognized by the same council and the board of trustees as competent to provide a satisfactory training in the field of pathology. This period of special training preparation shall include the following:

(a) Graduate training for one year in the various phases of clinical pathology.

(b) Training and experience of not less than two years in a department of pathologic anatomy.

(c) Such training may be combined or in sequence.

3 A fifth year of training or practice in pathology.

D Special qualifications.

1 The board may accept candidates without special training as outlined in Section C above provided that:

(a) The candidate shall have been for a period of five years of professorial rank in a department of pathology in an approved medical school, or

\* NOTE: In case of an applicant whose education and/or training has been received outside the United States or Canada, his credentials must be acceptable to the National Board of Medical Examiners and the American Board of Pathology.

(b) The candidate shall have been practicing pathology for ten years in a senior position in a hospital, having an adequate department of pathology, and approved by the Council on Medical Education and Hospitals of the American Medical Association

Candidates with special qualifications, as outlined in Section D above, may be certified without examination, at the discretion of the board

#### APPLICATION BLANK AND FEE

Application must be made on the special form which may be procured from the secretary and forwarded with other required credentials and the application fee. Applications cannot be given consideration by the board unless accompanied by the application fee

The application or examination fee for candidates is \$35. If certified without examination \$10 of fee will be refunded. If the candidate fails in his examination he will be admitted to a second examination after one year, but not later than three years, without additional fee. After two reexaminations the applicant must file a new application and pay an additional fee before a fourth examination will be given

The examination fee of \$35 has been arrived at after careful consideration and is based on actual estimates of the expense of examination and administration. None of the board members receive any compensation for their services except actual expenses incurred

If the applicant, for any reason, is deemed ineligible for examination by the board his fee will be returned, however the application fee is not returnable after the candidate has officially been accepted for examination and notified to report for the same

#### EXAMINATIONS

Written and oral examinations will be held at or near the time and place of national medical meetings at the discretion of the board. If a number of applications from any region of the country are received an examination in conjunction with a national medical meeting in that section will be arranged so that the financial outlay of the applicant in meeting the examiners will be as small as possible

The examinations are to be based on the broad principles of pathology with emphasis on diagnosis and interpretation. The applicant may apply for certification in either pathologic anatomy or clinical pathology, or both

#### DEFINITIONS

1 Pathologic anatomy is that branch of pathology which deals with the morphological aspects of disease, recognition being given that this definition covers two phases of pathology

(a) The applied phase, with special attention to biopsy description and diagnosis

(b) The academic phase of teaching and general morphological diagnosis

2 Clinical pathology is that branch of pathology which deals with bacteriology, immunology, biochemistry, parasitology, hematology, and clinical microscopy, in relation to the diagnosis, prognosis, and treatment of clinical disease

#### REEXAMINATIONS

In case the candidate fails in the qualifying examination he will be eligible for reexamination after one year has elapsed, but he must give written notice of his intention to appear for reexamination. Two reexaminations are allowed without an additional fee, providing they are taken within a three year period. The candidate who fails three times must file a new application and pay a second \$35 fee before he is eligible for further examination

#### REVOCATION OF CERTIFICATES

Certificates issued by the American Board of Pathology are subject to the provisions of the Articles of Incorporation No. VI, Section 4. Any certificate issued by the Board of Trustees shall be issued subject to revocation in the event that

(a) The physician or party so certified shall have made any misstatement or misrepresentation of a material fact in his application or in any other communication to the board or its representatives, which misstatement or misrepresentation affected the eligibility of the physician or the party so certified

(b) The issuance of such certificate has been made contrary to or in violation of any of the rules, laws, or regulations of this corporation

(c) It is ascertained that the physician or party so certified is not eligible in fact to receive such certificate

(d) The physician or party receiving such certificate shall prior to the issuance of such certificate or thereafter have been convicted by a court of competent jurisdiction of a felony or

of any misdemeanor, which misdemeanor in the opinion of the Board of Trustees, shall involve moral turpitude

(e) The physician or party receiving such certificate shall prior thereto, or thereafter, have his license to practice medicine revoked

(f) The physician or party receiving such certificate shall be expelled from any of the societies or organizations making him eligible to this corporation as an applicant for such certificate

All communications should be addressed to the secretary-treasurer

#### AMERICAN BOARD OF PEDIATRICS, Inc

HORTON CASPARI, President, Nashville, Tenn

C ANDERSON ALDRICH, Secretary-Treasurer, 707 West Fullerton Avenue, Chicago

FRANKLIN PAUL GENGEBACH, Denver

HUGH McCULLOCH, St. Louis

CHARLES F. McKHANN JR., Ann Arbor, Mich

DONOVAN J. McCUNE, New York

EDWARD BYER SHAW, San Francisco

HAROLD COE STUART, Boston

ALFRED AUGUSTUS WALKER, Birmingham, Ala

#### ORIGIN

The American Board of Pediatrics was established in June 1933 by joint action of the American Pediatric Society, the American Academy of Pediatrics and the Section on Pediatrics of the American Medical Association after consideration of the report of a committee on pediatrics as a special field of medical practice. The committee recommended that the certification plan adopted and in use in the fields of ophthalmology, otolaryngology, gynecology and obstetrics, and dermatology be adapted to pediatrics

Any method of certification in any specialty must be national in scope, must in its ultimate analysis be controlled by the men in each special field and must be independent of society membership or affiliation. The American Board of Pediatrics fulfills these three essentials. A uniform standard of competency is set up the character of which is assured through the affiliation with the Advisory Board on Medical Specialties. The board is controlled by pediatricians, its membership being composed of three men appointed by each of the three national pediatric societies. The board is not a medical society, however, and certification is independent of society affiliation

The American Board of Pediatrics was incorporated in the state of Delaware in November 1933 as a nonprofit organization

#### FUNCTION

The functions of the board are outlined in the articles of incorporation as follows

"To encourage the study, improve the practice and elevate the standards of pediatrics and to grant and issue to physicians, duly licensed by law, certificates or other equivalent recognition of special knowledge in pediatrics"

The board has interpreted this to mean that its efforts to encourage and improve the practice of pediatrics shall be limited to its function of certification of competency in the specialty. Obviously other organizations are better able to further the general improvements in pediatrics

The board specifically defines its activities as follows

1 To establish standards by which the competency of men to practice pediatrics may be estimated

2 To arrange, control and conduct examinations to test the qualifications of those desiring certification as pediatricians

3 To grant certificates of qualification to those applicants who meet the standards successfully

The board further feels that in carrying out these activities it is merely acting as the agent of the three societies which appointed its members and initiated the project

No financial recompense or any kind is made to any member of this board except to cover actual traveling expenses to meetings and examinations. The application fee is \$50

#### CERTIFICATE—NOT A DEGREE

Certificates granted are in no sense degrees nor do they purport to confer upon any person any legal qualification, privilege or license to practice pediatrics. Neither does the board intend in any way to limit the activities of any licensed physicians. It is merely attempting to standardize qualifications and to issue certificates to those who voluntarily comply with the requirements

#### VALUE OF THE CERTIFICATE

It is anticipated that the certificate will become of value in that both the medical and lay public including hospital directors will soon utilize the certificate from this board as a means of

discriminating between those who are well grounded as pediatricians and those who are not

A certificate is required as one of the qualifications for new members of the American Academy of Pediatrics. The certificate of the American Board of Pediatrics is recognized by the Council on Medical Education of the American Medical Association. Holders of certificates are so designated in the directory of the American Medical Association.

A joint Directory of Specialists certified by the fifteen specialty boards was published in 1942 by the Advisory Board for Medical Specialties.

Lists of those holding certificates from this board are published in this Directory of Medical Specialists and additional lists of new licentiates are published in the Journal of Pediatrics and the American Journal of Diseases of Children. The American Medical Directory indicates diplomates of this and other boards by means of abbreviations and symbols (A B I) appearing in the biographic records.

This board, in cooperation with the Council on Medical Education and Hospitals of the American Medical Association, is conducting a survey of institutions providing acceptable residencies and internships in pediatrics.

#### APPLICANTS FOR CERTIFICATES

*Requirements for Applicants*—Each applicant for a certificate must establish in a manner satisfactory to the board that he is of high ethical and professional standing, is a graduate of a medical school which is satisfactory to the board, and has received adequate training in pediatrics as a specialty in addition to passing the examination given by this board and is a citizen of the United States, of its dependencies, or of Canada.

Applicants are divided into two classes, according to the length of time they have been engaged in the specialty.

Following is the classification of applicants for certification. Changes may be made in future years based upon the general requirements as adopted by the Advisory Board of Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association.

*All applicants must take the examinations*

*Group I*—Physicians who have specialized in pediatrics for ten years or more. After July 1, 1943, Group I will be abolished.

*Group II*—The minimum requirements for this group are as follows:

Graduate of a Class A medical school

One year's intern service in a recognized hospital

Two years' service in a pediatric center

An additional term of two years of specialized study and/or practice

The board defines service in a pediatric center as full time devoted to rounded experience in an acceptable hospital or a graduate course, which includes ward and outpatient service and both therapeutic and preventive pediatrics. The time served in pediatric centers need not be continuous or spent in the same institution. In the case of a post-graduate course an academic year will meet the requirement of one year's work. A maximum of six months of this time may be spent in full time contagious work in a recognized hospital.

The application fee is \$50 and must be remitted with the application. Refund will be made only if the applicant is refused examination. The applicant who has failed in an examination will not be required to pay a second fee if he takes another examination after two years have elapsed and he has presented evidence of continued study and activity in pediatrics.

Application must be made on special blanks which may be secured from the secretary. These must be sent to the secretary at least *four months* before the date at which the candidate expects to take the examinations.

Letters from two competent pediatricians recommending each applicant must be sent to the secretary of the board. These letters are not to accompany the application, but should be sent directly to the secretary. No member of the board, or official examiner, may recommend any applicant.

A list of papers or books published must be sent with the application blank.

#### INFORMATION CONCERNING EXAMINATIONS

Examinations will be held at or near the time and place of meetings of the American Medical Association and of the American Academy of Pediatrics, or at other times and places at the discretion of the board, depending on the number of applicants from any region of the country. It is proposed to arrange examinations in different cities so that as little financial burden

as possible will be placed upon the applicants in meeting the examiners.

The purpose of these examinations is to determine the applicant's competency to practice pediatrics. This board feels that the best impression of an applicant's ability can be obtained by oral examination although written ones may be substituted at times. However, at the present time this board is also giving a written examination at least six weeks preceding the oral examination. This written examination is given locally under a monitor. It is not proposed at the present time to require the applicant to send in case reports. The board feels that growth and development are fundamental parts of pediatric training.

It should be emphasized that competency in the *practice* rather than in the theory of pediatrics is required.

Communications should be addressed to the secretary.

## THE AMERICAN BOARD OF PLASTIC SURGERY, INC

JOHN STAIGE DAVIS, Chairman, Baltimore

GEORGE M. DORRANCE, Vice Chairman, Philadelphia

JAMES BARRETT BROWN, Secretary-Treasurer, 400 Metropolitan Building, St. Louis

GUSTAV AUFRICHT, New York

VIRRAY P. BLAIR, St. Louis

ROBERT H. IVY, Philadelphia

HAROLD L. D. KIRKHAM, Houston, Texas

WILLIAM S. KISKADDEN, Los Angeles

SUMNER L. KOCII, Chicago

WILLIAM C. LADD, Boston

GORDON B. NEW, Rochester, Minn.

GEORGE WARREN PIERCE, San Francisco

ERNEST FULTON RISDON, Toronto, Ont., Canada

FERRIS SMITH, Grand Rapids, Mich.

JEROME P. WEBSTER, New York

#### HISTORY

The American Board of Plastic Surgery, tentatively organized in June 1937, by representatives of widely distributed groups interested in this special type of surgery, received recognition as a subsidiary of the American Board of Surgery in May 1938, and was given the status of a major board in May 1941 by the Advisory Board for Medical Specialties. It is composed of representatives from the American Association of Plastic Surgeons, the Surgical Section of the American Medical Association, the American Surgical Association, the Southern Surgical Association and the American College of Surgeons.

The aim of the American Board of Plastic Surgery is to encourage the study, improve the practice, and advance the cause of plastic surgery, and to grant and to issue certificates of recognition of special knowledge in plastic surgery to surgeons meeting the requirements.

#### PURPOSES OF THE BOARD

The purposes of the board are:

1 To elevate and establish standards of fitness to practice plastic surgery.

2 To arrange and conduct examinations for determining the qualifications of those who request a certificate of their ability in the field of plastic surgery, to establish qualification requirements for applicants, and to confer certificates upon those who meet the requirements of the board.

3 To improve and widen the existing opportunities for the training of the plastic surgeon.

4 To study and evaluate local and foreign teaching centers and opportunities for experience in and the study of plastic surgery.

#### GENERAL QUALIFICATION REQUIREMENTS

1 Moral and ethical standing in the profession satisfactory to the board.

2 Membership in the American Medical Association, or, by courtesy, membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association.

#### PROFESSIONAL QUALIFICATION REQUIREMENTS

1 Graduation from a medical school recognized by the Council on Medical Education and Hospitals of the American Medical Association.

2 Completion of an internship of not less than one year in a hospital approved by the said Council, or what would constitute in the opinion of the board, the equivalent of such training

3 A period of graduate study in surgery of not less than two years beyond the intern year to be taken in a recognized graduate school or hospital

4 An additional period of not less than two years of graduate study in plastic surgery, also to be taken in a recognized graduate school or hospital. This period of training shall cover the technical and clinical phases of plastic surgery, and the basic sciences of anatomy, physiology, pathology, bacteriology, and biochemistry as they are related to plastic surgery

5 An additional period of two years of surgical practice a fair percentage of which shall be in plastic surgery

The above training may be taken in a recognized graduate school of medicine, or as resident in surgery in an acceptable hospital, or under a sponsorship accredited by the American Board of Plastic Surgery for such training. By the latter statement is meant that one may secure the necessary training as an assistant to an accredited surgeon, provided suitable facilities for the education of the candidate are offered. It is understood that the board will accept a combination of such training as outlined above, for example, one may take a graduate course in an acceptable graduate school for one year, a residency for two years, and an assistantship in plastic surgery for two years. Where circumstances permit the applicant to major in plastic surgery during the second of the two years on a general surgical service, the second year of the two years of general training may, with the approval of this board, be credited on his period of special training in plastic surgery.

In exceptional instances, the board may, at its discretion accept for examination candidates who have met all the above preliminary requirements, have been graduated in medicine at least ten years but whose formal training does not comply with the full requirements to be exacted in the future

#### CLASSIFICATION OF APPLICANTS

**Group A—Founders Group**—Those to be certified without formal examination as to professional qualifications. This group shall be composed of men who have already amply demonstrated their fitness to do acceptable plastic surgery and who have been graduated in medicine at least ten years. (This group is now closed)

**Group B—Examinees Group**—Those to be formally examined as to professional qualifications. To be eligible for examination by this board, all candidates shall be required to possess the preliminary and basic medical qualifications accepted by the Advisory Board for Medical Specialties as applied to all specialties

Applicants who have qualified under Group B shall be required to submit twenty-five diversified case reports, together with photographs of before and after treatment made from unretouched negatives

#### EXAMINATIONS

The qualifying examination will be divided into Part I, written, and Part II, oral and practical

Part I shall consist of a written examination upon questions prepared by the examining committee which concern the theory and practice of plastic surgery. In addition to the above the examination shall include questions upon applied anatomy, applied physiology, pathology, clinical laboratory methods local and general anesthesia, shock, hemorrhage, the handling of tissues, wound healing, related bacteriology and surgical accidents all as related to plastic surgery

Part II shall as far as possible be of a practical nature and shall be conducted by no fewer than two competent judges, selected by the examining committee

The clinical examination shall include any or all of the following

(a) The exhibition of patients who have undergone or who are undergoing treatment.

(b) Examination diagnosis and presentation of a plan of correction by the applicant of cases provided by the examiners

(c) Oral examination of the applicant and observations made in the operating room, treatment rooms, and wards

In order to be eligible for Part II of the examination, a candidate shall have successfully passed Part I

A candidate shall be required to receive a passing average for each Part in order to receive the board's certificate. No

candidate shall pass Part I or Part II of the examination who does not receive a grade of 65 per cent or over in each subject or each Part. An average grade of 75 per cent shall be considered as passing

#### REEXAMINATIONS

Candidates may be reexamined as often as they desire, provided that one year shall elapse between examinations, except in such case as the board may, for good and sufficient reason, deny a candidate the privilege of reexamination

#### FEES

The fee for the examination and the certificate of the American Board of Plastic Surgery is \$100. Of this sum \$25, which is not returnable, must accompany the case reports, \$25 should be paid when Part I of the examination is taken, and \$50 when Part II is taken. There shall be no refunds

This fee may be increased at the discretion of the board, when the number of candidates decreases and when the expenses of the examinations and other activities of the board demand

This board is a nonprofit organization. The fees of candidates are used solely for defraying the actual expenses of the board. The members of the board and their associates receive no emoluments. All surplus moneys derived from fees will be used to aid in improving existing opportunities for the training of plastic surgery

#### CERTIFICATION

A certificate bearing the seal of the board and the signatures of its officers, will be issued to each successful candidate attesting his qualification in plastic surgery

It is the board's prerogative to determine the fitness professionally and ethically of any candidate for its certificate

The action or decision of the American Board of Plastic Surgery regarding the certification of any candidate shall be final

#### REVOCATION OF CERTIFICATE

The American Board of Plastic Surgery shall have the sole power, jurisdiction, and right to determine and decide whether or not the evidence or information placed before it is sufficient to constitute grounds for revocation of any certificate issued by the board and the decision of the board in the premises shall be final

Address communications to the secretary

#### HISTORY AND STATEMENT OF PURPOSES

The American Board of Psychiatry and Neurology was founded in 1934 following conferences of committees appointed by the American Psychiatric Association, the American Neurological Association and the Section on Nervous and Mental Diseases of the American Medical Association. This act was taken in response to a widespread demand for specialists in psychiatry and neurology for some years of delay. The fully qualified specialist from the world's medical profession was lacking in number and the training of the inferior training and inadequate experience. That this demand was by no means limited to those who practice psychiatry and neurology is indicated by the formation of corresponding boards covering internal medicine, surgery, and the other specialties. The success of this method of determining the quality of specialists is indicated by the increasing number of candidates for the

examinations, and by the listing accorded in the American Medical Directory to those specialists holding the certificates of the various boards

#### CONSTITUTION AND ACTIVITIES

The American Board of Psychiatry and Neurology is composed of twelve members, four each from the American Neurological Association and from the American Psychiatric Association and two neurologists and two psychiatrists elected by the Section on Nervous and Mental Diseases of the American Medical Association. Annual elections to fill the places of members whose terms have expired take place in each of the nominating associations with the understanding that neurology and psychiatry are always equally represented on the board. The board holds annual meetings in December of each year for the transaction of whatever business may come before it and also holds special meetings for the purpose of examining candidates and of passing upon the qualifications of those seeking the certificate without examination.

#### FUNCTIONS

- To determine the competence of specialists in psychiatry and neurology
- To arrange, control and conduct investigations and examinations to test the qualifications of voluntary candidates for certificates issued by the board
- To grant and issue certificates or other recognition of special knowledge in the field of psychiatry and neurology to successful voluntary applicants therefor
- To serve the public, physicians, hospitals and medical schools by preparing lists of practitioners who shall have been certified by the board
- To consider and advise as to any course of study and technical training, and to diffuse any information calculated to promote and ensure the fitness of persons desirous of qualifying for a certificate of qualification to be issued thereby

#### INFORMATION FOR APPLICANTS

##### EXCERPTS FROM ARTICLE VII OF THE BY-LAWS

**SECTION 1 Application for Certificate.** Application for certificates shall be considered by the secretary only when made formally on the official application blank in such form as may be adopted from time to time by the board of directors and when accompanied by an application fee in such amount as may be fixed from time to time by the board of directors.

**SECTION 2 Form of Certificate.** There shall be separate certification in psychiatry and in neurology and two certifications or a combined certification for those qualified in both fields. The certificates shall be in such form as is approved by the board of directors.

**SECTION 3 Requirements for Applicants.** Each applicant for a certificate must establish that—

- He is a physician duly licensed by law to practice medicine
- He is of satisfactory ethical and professional standing
- He is now a member of the American Medical Association, or a member of such medical societies as are recognized for purposes of certification by the Council on Medical Education and Hospitals of the American Medical Association. Exceptions to the foregoing may be made at the discretion of the board for good and sufficient reasons
- He has received adequate training in psychiatry or neurology, or both, as a specialty

**SECTION 4** No candidate is eligible for examination by the board until he has completed at least five years of special training and experience in neurology or psychiatry for a single certificate, or at least six years of training and experience for certification in both neurology and psychiatry.

#### CLASSES OF APPLICANTS AND FEES

Applicants may request certification in psychiatry, or in neurology, or in both psychiatry and neurology.

Limitation of practice to the specialty of psychiatry and/or neurology need not be complete provided a candidate both by his previous training, experience and standing, and by examination, can prove his competency to practice that specialty.

However, in case a physician has already been certified by one of the other boards as a specialist in another field, he will not be considered for certification in psychiatry and/or neurology except under special circumstances.

##### Class I

Physicians who graduated from medical school in 1919 or before and who have carried on specialized practice in neurology and/or psychiatry for at least fifteen years are to be considered on their professional record and passed, if satis-

factory to the Board, or further evidence of qualification or examination may be required.

A candidate in Class I who has received certification in either psychiatry or neurology may apply within three years for certification in the other field without additional fee. After three years such application shall be considered as a new application with corresponding fees.

When certification in Class I has been refused, the candidate may file application for reconsideration within three years without additional fee. After three years such application for reconsideration shall be considered as a new application with corresponding fees.

##### Class II

Physicians who graduated from medical school up to and including 1929 and who have practiced the specialty of psychiatry and/or neurology for at least five years will be required to pass an examination in psychiatry or neurology, or both.

##### Class III

Physicians who graduated after 1929, up to and including 1934, will be required to pass an examination to satisfy the board that they have adequate knowledge of all subjects specified in the by-laws for candidates graduating after 1934. Their previous training and experience must be acceptable to the board.

##### Class IV

Candidates graduating from medical school after 1934 shall fulfil the preceding general requirements as given in Section 3 of Article VII and the following special requirements.

#### PROFESSIONAL EDUCATION

(1) Graduation from a medical school approved by the Council on Medical Education and Hospitals of the American Medical Association.

(2) Completion of a general internship of not less than one year in a hospital approved by the same Council.

#### SPECIAL TRAINING

(These requirements are to be placed in force as soon as practicable after Jan 1, 1944. In the meantime a syllabus covering the knowledge required of the candidate has been prepared and is available to those who request it.)

Admission to the examination for certification in neurology or psychiatry requires a total experience of not less than five years. This period shall include the following:

1. A period of study, after the general internship, of not less than three full years in institutes, hospitals, clinics, dispensaries, laboratories, and other institutions recognized by the Council of the American Medical Association and approved by the American Board of Psychiatry and Neurology as competent to provide a satisfactory training in psychiatry and/or neurology.

(i) As subject matter,

|                    |                     |
|--------------------|---------------------|
| Neuro-anatomy      | Psychobiology       |
| Neurophysiology    | Psychopathology     |
| Neuropathology     | Neuroroentgenology  |
| Clinical neurology | Clinical psychiatry |

and other basic medical sciences, which, in the opinion of this board, are necessary to the proper understanding and treatment of psychiatric and/or neurologic disorders.

2. An additional period of not less than two years of practice in psychiatry and/or neurology.

3. Candidates wishing to be admitted to the examinations for certification in both fields must have had a minimum of six years of experience in both fields.

#### PAYMENT OF FEES

The candidate on filing his application shall accompany it with an application fee of \$25. When notified by the secretary that he is eligible for examination he shall send the examination fee of \$25 to the secretary at least two weeks before the date of the examination. The certification fee of \$25 is payable upon notification by the board that certification has been awarded the candidate in Class I on his record. No fees will be returned.

The same examination is given whether a candidate applies for certification in psychiatry, or in neurology, or in both psychiatry and neurology. The board requires some proficiency in neurology on the part of those it certifies in psychiatry and vice versa, but judges the candidate in accordance with the certificate he seeks.

Should a candidate receive certification in either psychiatry or neurology, he may apply within three years for partial examination for the certificate in the complementary subject, upon payment of a complementary examination fee of \$10. After three years, the second application shall be considered a new application, with corresponding \$25 fees.

# EXAMINATIONS

Date and places of examination are set by the board at its discretion and are announced in *The Journal of the American Medical Association* in the *American Journal of Psychiatry*, in the *Journal of Nervous and Mental Disease*, and in the *Archives of Neurology and Psychiatry*.

The examinations are designed to test the ability of the candidates to meet the situations in which they might at any time be called upon as specialists to assume responsibility. They will be of such a type that no adequately trained individual will fail, yet they will be sufficiently searching so that the specialist-in-fact will be separated from the specialist-in-name. Each candidate is required to identify and to discuss the function of the more important anatomic structures in the brain and spinal cord, to discuss gross and microscopic pathologic specimens and to interpret roentgenograms dealing with neurologic disorders. He is examined orally on the subjects of psychobiology and psychopathology. These examinations in the preclinical subjects usually last about two hours. Each candidate examines two patients with neurologic disorders and two with psychiatric disorders, and discusses with the examiners the various problems involved. One hour, on the average, is allotted to each of these four clinical examinations. The manner of examining both neurologic and psychiatric patients and the reasoning and deductions therefrom constitute the most important part of the examination. Some acquaintance with the history of psychiatry and neurology, with the body of doctrine, and with the recent advances, is presupposed.

## REEXAMINATIONS

A candidate who has failed in one examination is eligible to reexamination in the whole subject within three years on payment of a reexamination fee of \$10. A candidate who has failed in one examination and who does not apply for reexamination within three years or a person who has applied within that time but who has failed a second time will be considered a new applicant, with corresponding \$25 fees. The \$10 reexamination fee also applies to candidates conditioned in one or more subjects at any time within three years of the first examination, and is payable before each reexamination.

## HANDLING OF APPLICATIONS

An application, in order to be considered at any meeting must be in the hands of the secretary of the board not less than seventy days before the date of such meeting.

The secretary of the board on receipt of an application shall forthwith make inquiries from those to whom the candidate refers and from such other persons as the secretary may deem desirable and shall verify the candidate's record from the biographical records of the American Medical Association after which he shall forward the application to the committee on credentials. This committee shall consider the application and other information available and notify the secretary whether the application is accepted. The certification of a candidate in either psychiatry or neurology, or both shall be approved by a majority of the members of the entire Board at any meeting held for such certification.

## PLEDGE

Each candidate is required to sign the following pledge:

"I hereby make application to the American Board of Psychiatry and Neurology, Incorporated, for the issuance to me of a certificate of qualification as a specialist in (a) Psychiatry (b) Neurology, (c) Psychiatry and Neurology (check the one desired) and for examination relative thereto, all in accordance with and subject to its rules and regulations. Upon the issuance of the certificate I agree to and do become bound by the by-laws of the American Board of Psychiatry and Neurology, Inc., insofar as applicable. I agree to disqualification from examination or from the issuance of a certificate of qualification or to forfeiture and redelivery of such certificate of qualification in the event that any of the rules governing such examination are violated by me or for any one of the reasons set forth in the by-laws. I agree to hold said American Board of Psychiatry and Neurology, Inc., its members, examiners, officers and agents free from any damage or claim for damage or complaint by reason of any action they, or any of them, may take in connection with this application, such examination, the grade or grades given with respect to any examination and/or the failure of said corporation to issue to me such certificate of qualification."

## RULES AND REGULATIONS

(ART VII SEC 5 OF THE BY LAWS)

The board or directors, from time to time, by resolution adopted by the affirmative vote of a majority then in office may adopt, amend and repeal rules and regulations respecting

requirements of applicants, the nature and extent of examinations and investigations and issuance of certificates.

## REVOCATION OF CERTIFICATES (ART VII SEC 6 OF THE BY LAWS)

All certificates issued by the corporation shall be subject to the provisions of the certificate of incorporation and of the by-laws of the American Board of Psychiatry and Neurology, Inc. Each such certificate shall be subject to revocation in the event that:

- The issuance of such certificate or its receipt by the physician shall have been contrary to or in violation of any of the provisions of the corporation's certificate of incorporation or by-laws; or
- The physician so certified shall not have been eligible in fact to receive such certificate, irrespective of whether or not the facts constituting him so ineligible were known to any or all of the directors of the corporation or could have been ascertained by any or all of the directors of the corporation at the time of the issuance of such certificate; or
- The physician so certified shall have made any deliberate misstatement of fact in his application for such certificate or in any other statement or representation to the corporation its directors, representatives or agents; or
- The physician so certified shall have been convicted by a court of competent jurisdiction of a felony or of any misdemeanor involving in the opinion of the board or directors of the corporation, moral turpitude in connection with his practice of medicine; or
- The physician so certified shall have had his license to practice medicine revoked or shall have been disciplined or censured as a physician by any court or other body having proper jurisdiction and authority.

## FORM OF CERTIFICATE

The secretary shall have prepared subject to the approval of the board members a form of certificate containing the following wording:

THE AMERICAN BOARD OF PSYCHIATRY AND  
NEUROLOGY, INC.

This is to certify that \_\_\_\_\_ has satisfied the requirements of the board and is hereby certified as qualified to practice the specialty of Psychiatry and/or Neurology.

(Signed) President  
Vice President  
Secretary

Communications should be addressed to the secretary.

## HISTORY AND AUTHORITY FOR ORGANIZATION

The medical profession has long felt that there should be a standard or minimal requirements for the practice of any specialty in medicine in order to protect the public. The profession in general, and the specialists themselves. Some of the states have attempted by statute to prescribe such requirements in certain branches. Unless a better method of regulation be found, the other states would be likely to enact similar laws. The result would be forty-eight different standards for each of the many medical specialties. Obviously, a more practical solution would be for each special group to put its own name in order and place its mark of approval on those qualified to practice as specialists in that particular field. Accordingly

1932, five nation-wide radiologic organizations, the Section on Radiology of the American Medical Association, the American Roentgen Ray Society, the Radiological Society of North America, the American College of Radiology, and the American Radium Society, each appointed a committee of three members to confer and investigate the feasibility of establishing a qualifying board. The following men were appointed by these five organizations: Dr G W Holmes, J W Pierson, E L Jenkinson, W E Chrummerlain, E C Ernst, W F Manges, L R Sante, L C Kinney, A C Christie, Albert Soiland, W W Wisson, Henry Schmitz, Lester Hollander, Rollin H Stevens and B R Kirklin.

This combined committee met at Milwaukee in 1933, during the meeting of the American Medical Association, agreed unanimously that such a board should be established and so reported to the respective organizations. Each of the organizations approved the report, appointed three representatives, and empowered them to proceed to the formation of a national radiologic board. The members of the board thus chosen were: Drs W F Manges, L R Sante and B R Kirklin, representing the American Roentgen Ray Society; Drs A C Christie, E C Ernst and E L Jenkinson (succeeding Dr Byron H Jackson, originally appointed) representing the American College of Radiology; Drs R H Stevens, Henry Schmitz and H K Pancoast, representing the American Radium Society; Drs L J McNeill, M C Sosman and Albert Soiland, representing the Radiological Society of North America; and Drs L C Kinney, J W Pierson and G W Holmes, representing the Section on Radiology of the American Medical Association.

The board was incorporated, organized and held its first meeting in Washington, D C, in May 1934, at that time the by-laws were adopted and provision was made by resolution for its proper function. The officers of the board elected at this meeting were:

Dr H K Pancoast President  
Dr A C Christie, Vice President  
Dr B R Kirklin, Secretary-Treasurer

This move put into action the determined effort on the part of these five national organizations to improve the standards of the practice of radiology. It expects to accomplish this by various activities, such as the investigation and encouragement of facilities for graduate extension study and active clinical assistantships for men desiring to specialize in radiology; it will endeavor by regular examinations to determine the competence of specialists in radiology who apply for the certificate.

During 1934 the American Board of Radiology was accepted for membership in the Advisory Board for Medical Specialties and was also approved by the Council on Medical Education and Hospitals of the American Medical Association. Hereafter the list of Diplomates of the Board will take the place of the Council's list of approved radiologists, and the latter list will be discontinued.

#### PURPOSES

*First* To encourage the study and promote and regulate the practice of radiology.

*Second* To elevate the standards and advance the cause of radiology by encouraging its study and improving its practice.

*Third* To determine the competence of specialists in radiology, to arrange, control and conduct investigations and examinations, and to test the qualifications of voluntary candidates for certificates to be issued by the board.

*Fourth* To serve the public, physicians, hospitals and medical schools by preparing lists of practitioners who shall have been certified by the board.

#### VALUE OF CERTIFICATE

The national radiologic organizations which have participated in the formation of the board and are sponsoring its activities, as well as other organizations, attach considerable importance to its certificate. It is expected that both the medical and the lay public, including hospital directors, will soon come to utilize the certificate from this board as a means of discriminating between those who are well grounded as specialists in radiology and those who are not.

To this end lists of those holding certificates from this board will be published and issued from time to time by the board. Similar lists will be published by the *American Journal of Roentgenology and Radium Therapy*, *Radiology*, and *The Journal of the American Medical Association*. The Directory of the American Medical Association will indicate by a numerical symbol in the biographic data of those whose names are eligible to appear on these lists that they are diplomates of this board.

For emphasis it is repeated that the board does not intend in any way to interfere with or limit the professional activities of any duly licensed physician, but it does aim toward standardized qualifications for those who claim to be specialists in radiology.

#### CERTIFICATES

A certificate will be issued to each candidate who meets the requirements of the board, to the effect that the holder of the certificate has had adequate training in radiology and has successfully fulfilled the requirements of the board.

A certificate granted by this board does not of itself confer, or purport to confer, any degree, or legal qualifications, privileges, or license to practice radiology. Certificates of the board shall be issued upon one of two forms:

1 A certificate to the effect that the applicant has been found qualified to practice radiology in all its branches.

2 A certificate to the effect that the applicant has been found qualified to practice radiology in one or more of the following special fields: (a) roentgenology, (b) diagnostic roentgenology, (c) therapeutic radiology.

#### DEFINITIONS

For the purposes of this board, the following definitions are adopted:

1 Radiology is that branch of medicine which deals with the diagnostic and therapeutic application of radiant energy including roentgen rays and radium.

2 Roentgenology is that branch of radiology which deals with diagnostic and therapeutic application of roentgen rays.

3 Diagnostic roentgenology is that branch of radiology which deals with the diagnostic application of roentgen rays.

4 Therapeutic radiology is that branch of radiology which deals with the therapeutic application of roentgen rays and radium.

#### GENERAL REQUIREMENTS

Each applicant for admission to the examination shall be required to present evidence that he has met the following standards:

##### (A) GENERAL QUALIFICATIONS

1 Satisfactory moral and ethical standing in the profession.

2 A license to practice medicine in the state or county in which he resides.

3 Membership in the American Medical Association, or membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association. Except as herein provided, membership in other societies shall not be required.

4 That the applicant holds himself out to be a specialist in radiology or one of its branches as defined under "Definitions," and that he devotes his time primarily and principally (at least 75 per cent) to the practice of radiology or one of its branches.

5 That he is a citizen of the United States or Canada. Candidates from other countries must be permanent residents of that country and native citizens thereof.

##### (B) GENERAL PROFESSIONAL EDUCATION

1 Graduation from a medical school recognized by the Council on Medical Education and Hospitals of the American Medical Association. If the applicant is a resident of the United States or one of its possessions and is a graduate of a medical school outside the United States or Canada, he must have a certificate of The National Board of Medical Examiners.

2 Completion of an internship of not less than one year in a hospital approved by the same Council.

##### (C) SPECIAL TRAINING

(Applicable to candidates who begin their training on or after January 1, 1942, and to all candidates examined after January 1, 1945.)

1 After completion of the internship there shall be a period of special training in radiology of not less than three years in clinics, hospitals or dispensaries recognized and approved by The American Board of Radiology and the Council on Medical Education and Hospitals of the American Medical Association as competent to provide a satisfactory training in radiology. This period of specialized training shall include:

(a) Graduate training in pathology, radiation physics and radiobiology.

A period of six months full-time training in pathologic anatomy is recommended but where this is not possible to arrange the student, during his three-year training period may, by attending pathologic conferences, postmortem examinations and studying removed tissues, receive adequate training in pathology. It is recommended that radiation physics be taught by a combination of didactic lectures, practical examples, and direct clinical demonstrations.

(b) An active experience (residency) of not less than twenty-four months in an institution, the radiologic department of which is recognized and approved by The American Board of Radiology and the Council on Medical Education and Hospitals or the American Medical Association as capable of providing satisfactory training.

By special permission of the board all or part of this training may be obtained under the immediate preceptorship of a radiologist or group of radiologists recognized by The American Board of Radiology as offering appropriate facilities for this type of postgraduate experience. Or the board will accept a combination of training as outlined in (a) and (b)—for example, one may take a graduate course, including the basic sciences, in an accredited graduate school for one year, a residency for one year, and a preceptorship for one year, or he may take a graduate course for one year plus either a residency or preceptorship for two years.

(c) Examination in the basic sciences of radiology as well as the clinical aspects thereof.

These examinations should be given by the student's instructors in order to allow those responsible for his training to certify to the board that he is adequately prepared.

In the current emergency the board will allow one year of military service spent in a radiologic department in the United States Army, Navy or Marine Corps to be applied toward the satisfaction of one year of graduate training.

#### APPLICATIONS

The board desires to appraise the candidate's educational opportunities (premedical, medical and radiologic), the ability of his instructors, his hospital and teaching positions, his original investigations, his contributions to radiologic literature, his membership in medical societies, and his local and general reputation.

For this purpose, application must be made on a special blank which may be obtained from the secretary. No application will be considered unless made on the regular application blank. This application shall be forwarded with the required data, two unmounted photographs, and the fee of \$35, at least two months before the date of the examination.

#### FEE

A fee of \$35 must accompany each application blank. This fee will not be returned and no application will be considered until the fee is received. This fee has been carefully computed and is used entirely for administrative purposes. Members of the board and special examiners do not receive any compensation except for actual expenses connected with holding the examinations. As the number of candidates decreases, it may become necessary to raise the fee.

Checks should be made payable to the American Board of Radiology.

#### EXAMINATIONS

Each year the board will hold an examination in conjunction with the annual meeting of the American Medical Association, and, when sufficient applications are on file, a second examination will be held in conjunction with the annual meeting of the American Roentgen Ray Society and/or the Radiological Society of North America.

For the present, examinations consist of practical and oral examinations, although written examinations may be added later. The examinations are designed to test the candidate's fitness to practice radiology or one of its branches as a specialty. The board will endeavor to adapt this examination to the candidate's experience and years of practice. It will try especially to ascertain the breadth of his clinical experience, his knowledge of the basic sciences of radiology and likewise his knowledge of the recent literature on radiology, and his general qualifications as a specialist in this branch of medicine.

The examination consists of tests in film interpretation and an oral examination in pathology, physiology, radiophysics and

radiobiology as well as the clinical applications of roentgen rays and radium. The applicant is also examined in "professional adaptability" in an attempt to ascertain his attitude toward his fellow practitioners and his patients.

Whenever an applicant fails to pass the examination, the board if requested will make suggestions as to suitable courses of instruction for the purpose of overcoming his deficiencies.

#### REEXAMINATIONS

If the candidate fails in the first examination he will be admitted to a second examination after one year has elapsed but not more than three years. He must give sixty days' notice of his intention to appear for reexamination, and pay an additional fee of \$15. If a candidate who has failed does not appear for reexamination before the expiration of three years, he will be required to make a new application and pay an additional fee of \$35.

A candidate having failed twice may after one year have elapsed file a new application which must be accompanied by the fee of \$35.

#### FINAL ACTION OF THE BOARD

The final action of the board is based on the applicant's professional record, training and attainments in the field of radiology as well as on the results of his examination. Any radiologist who is practicing radiology honorably and efficiently should have no difficulty in obtaining a certificate. This board has been organized not to prevent qualified radiologists from obtaining certificates but to assist them in becoming recognized in their communities as men competent to practice in the special field of radiology.

#### REVOCATION OF CERTIFICATES

Certificates issued by this board are subject to the provisions of the Articles of Incorporation and the By-Laws. According to Article IX Section 4 of the By-Laws "Any certificate issued by the Board or Trustees shall be subject to revocation in the event that:

(a) The issuance of such certificate or its receipt by the physician so certified shall have been contrary to or in violation of any provision of the Certificate of Incorporation of this the American Board of Radiology or of these by-laws, or

(b) The physician or party so certified shall not have been eligible in fact to receive such certificate or

(c) The physician or party so certified shall have made any misstatement of fact in his application or in any other communication to the board or its representatives or

(d) The physician or party so certified shall have been convicted by a court of competent jurisdiction of a felony or of any misdemeanor involving, in the opinion of the Board of Trustees, moral turpitude, or

(e) If the physician or party so certified shall have had his license to practice medicine revoked or shall have been expelled from one of the societies or organizations which is represented by this corporation through eligibility of such society or organization to nominate and appoint members of this corporation."

Communications should be addressed to the secretary.

#### HISTORY

The organization of the American Board of Surgery was completed on Jan. 9 1937. A plan for this organization had been carefully studied by a general committee representative of certain general and sectional surgical societies called together

through the initiative of the American Surgical Association. As a result of the deliberations of this general committee a tentative plan of organization was adopted. This plan was reported to the cooperating surgical societies and was approved with the understanding that the board, when organized, would have the power to change or modify the proposed plan as it saw fit. This board has been created in accordance with the action of the Advisory Board for Medical Specialties as approved by the Council on Medical Education of the A M A, which has named certain specialty fields as being suitable to be represented by such boards. These boards have the two-fold purpose of certifying those found to be qualified after meeting reasonable requirements, and of improving existing opportunities for the training of specialists within the field concerned. This is to be done for the protection of the public and the good of the specialty.

#### PERSONNEL

\*The cooperating surgical societies selected jointly to form the board appointed their representatives as follows:

|  |    |
|--|----|
| The American Surgical Association      | 3  |
| The Surgical Section of the A M A      | 3  |
| The American College of Surgeons       | 3  |
| The Southern Surgical Association      | 1  |
| The Western Surgical Association       | 1  |
| The Pacific Coast Surgical Association | 1  |
| The New England Surgical Society       | 1  |
|  | —  |
|  | 13 |

The term of membership is for six years. Each cooperating association has the appointing power of its representatives subject to the approval of the board.

#### PURPOSES

(a) To conduct examinations of satisfactory candidates who seek certification by the Board.

(b) To issue certificates of qualification to all those meeting the board's requirements.

(c) To improve the opportunities for the training of the surgeon.

#### REQUIREMENTS

##### (A) GENERAL QUALIFICATIONS

1 Moral and ethical standing in the profession satisfactory to the board.

The board, believing that the practice of "fee splitting" is pernicious, leading as it does to a traffic in human life, will reserve the right to inquire particularly into any candidate's practice in regard to this question.

2 Membership in the American Medical Association or, by courtesy, membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the A M A. Except as here provided, membership in other societies shall not be required.

3 Those who have limited their activities to the practice of surgery.

4 In exceptional instances the board may, in its discretion, accept for examination candidates who have met all preliminary requirements and have been in practice from six to sixteen years but whose formal training does not comply with the full requirements to be exacted in the future.

The board recognizes two groups of candidates who may be eligible for certification.

(A) The Founders Group—those who have already amply demonstrated their fitness as trained specialists in surgery. Application for membership in this group was open until Jan 9, 1940. Those who received the board's approval were accepted for membership without examination from the following:

1 Those who from the time of the board's organization, Jan 9, 1937, held the position of professor or associate professor of surgery in the approved medical schools of the United States or Canada.

2 Those who for fifteen years prior to the board's organization limited their practice to surgery and met the general qualifications required.

\*The first three of these associations, being national in scope, were allotted three representatives each, the remaining associations, one

3 Such members of the cooperating societies represented on the board, in good standing Jan 9, 1937, who were invited to membership in this group.

*This group was closed Jan 1, 1940, no further applications received.*

#### (B) Qualified by examination—

In addition to the general qualifications the requirements for this group shall be as follows:

##### (B) PROFESSIONAL STANDING

1 Graduation from a medical school of the United States or Canada recognized by the Council on Medical Education and Hospitals of the A M A, or graduation from an approved foreign school.

2 Completion of an internship of not less than one year in a hospital approved by the same Council, or its equivalent in the opinion of the board. This internship may be rotating or one devoted to a single branch of medicine as, for example, surgery, medicine, pathology, etc.

##### (C) SPECIAL TRAINING

After the completion of the year's internship there shall be a period of special training in surgery of not less than five years. During this period one's entire time must be devoted to surgical training supplemented by sufficient experience in the basic sciences to comply with the provisions of paragraph 2. Such training may be taken in a recognized graduate school of medicine, as resident in surgery in an acceptable hospital, or under a sponsorship accredited by the American Board of Surgery for such training.† By the latter statement is meant that one may secure the necessary training as an assistant to an accredited surgeon, provided suitable facilities for the education of the candidate are offered. By an accredited surgeon is meant one who has been certified by the American Board of Surgery or whose professional standing is acceptable to this board. It is understood that the board will accept a combination of training as outlined above—

(For example, one may take a graduate course in an acceptable graduate school for one year, a residency for two years, and an assistantship of two years.)

This period of special training shall be of such character that the relation of the basic sciences of anatomy, physiology, pathology, bacteriology and biochemistry is emphasized. Knowledge of these sciences as applied to clinical surgery will be required in the examination.

Adequate operative experience in which the candidate has assumed the whole responsibility will be required.

The above requirements, especially those referring to surgical training, are subject to change from time to time as the existing opportunities for training in this field of specialization may be broadened.

In accordance with an action by the Advisory Board for Medical Specialties and subsequently approved by the American Board of Surgery a candidate who is not a citizen of the United States or Canada but who is a resident of either country shall have taken out first papers for citizenship and shall have been certified by either the National Board of Medical Examiners or licensed to practice medicine in the United States or Canada by a state board of licensure. A period of at least three years from the date of licensure to practice medicine in either of these countries must elapse before such a candidate may apply for qualification.

The American Board of Surgery will certify to the qualifications of those limiting their work to proctology in the following manner:

A The board will issue to those established in this field, who have been selected by a cooperating committee of recognized proctologists and approved by the American Board of Surgery, a certificate stating that such a candidate is qualified to practice proctology. This group is to be given this recognition without examination upon meeting the above requirements. As has been the custom for founder groups of all specialties this recog-

†The board makes no attempt to classify hospital residencies, usually accepting those approved by the American College of Surgeons and the Council on Medical Education and Hospitals of the American Medical Association.

dition will be extended to those properly qualified who shall apply within two years or until Jan 1, 1944

B For candidates who cannot be classified in Group A but who meet the following requirements the board will issue a certificate indicating that they have qualified by examination. The requirements exacted for this group are as follows

1 To meet all of the requirements as exacted of those wishing to qualify in the field of general surgery with the exception that one of the five required years of training in surgery may be devoted to the proctologic field

2 To pass the same examination as is given to those wishing to qualify in the general surgical field which is outlined elsewhere in this booklet

3 To pass a special examination in proctology which will be given by a committee appointed by the proctologic group. This examination will be given on the morning of the day following the examination in Part II and shall be a practical (bedside) examination in proctology, including diagnosis and surgery of diseases of the colon, rectum and anus

Those wishing to be certified in the proctologic field should so indicate when writing for an application blank

#### EXAMINATIONS

The qualifying examination will be divided into Part I (written) and Part II (clinical, bedside and laboratory). In both of these parts, as previously stated a knowledge of the practical application of the sciences fundamental to surgery will be required

##### PART I

This may be given simultaneously in as many centers as the board may determine suitable for the purpose. A candidate to be eligible for Part I must meet all the requirements for Group B candidates. A card of admission to this part of the examination will be forwarded to the candidate from the secretary's office, certifying that these requirements have been met as well as due notice as to the time and place of the examination

The examination in Part I shall cover a one-day period. There shall be two sessions of three hours each. This written examination shall concern itself primarily with general surgical problems and in addition the application of the basic sciences of surgery to these problems

##### PART II

In order to be eligible for Part II a candidate must have successfully passed Part I, in addition to having met the necessary preliminary requirements and having presented definite evidence of an adequate training in operative surgery satisfactory to the board

This part of the examination shall be oral and practical and cover a one-day period, the schedule being arranged somewhat as follows

#### 8-9 A M.—REGISTRATION

9 A M.-12 Noon—Clinical Surgery (diagnosis management and the application of Physiology, Biochemistry and Bacteriology, as the case being examined upon may offer an opportunity for doing so. X-ray plate interpretation will also be included)

2-5 P M.—Applied Anatomy and Surgical Pathology

The examinations in Part II are conducted in certain centers of the country selected by the board. It is the board's desire to arrange these centers so as to geographically meet the needs of the candidates, on condition that suitable examination facilities can be provided. The examination in this part will be conducted by members of the board living in the region of the country in which they are held, together with selected members of the Founders Group resident in the center chosen

#### GRADES

A candidate must receive a passing average for each part to be entitled to the board's certificate. No candidate shall pass a part who does not receive a grade of 60% or over in each subject of such a part. An average grade of 75% shall be considered as passing in each part. The following values have been assigned to Part II on the basis of a total of 100%: Clinical Surgery 50%, Anatomy 30%, Pathology 20%

A candidate who fails in his examination in Part I shall have his papers reviewed by the Examination Committee

#### REEXAMINATIONS

Candidates may be reexamined as often as they desire provided one year shall elapse between examinations, except that the board may for good and sufficient reason, deny a candidate the privilege of reexamination

#### FEEES

The fee for Group A Founders Group, (closed Jan 1, 1940) was \$25

The fee for Group B shall be \$75 payable as follows: \$5 registration fee which shall be returned if the candidate is not accepted for examination; \$20 for Part I and \$50 for Part II

Candidates shall be required to pay the same fees for Parts I and II at each reexamination in these parts

The fee for a reexamination in a single subject shall be as follows: Clinical Surgery, \$15; Anatomy, \$10; Pathology, \$10

For those wishing to be certified in the proctologic field the fees shall be as follows

The fee for the Founders Group in Proctology shall be \$25

The fee for the Examination Group in Proctology shall be as follows. In addition to the above fee of \$75 as required of all Group B candidates a fee of \$25 will be charged for the special examination in the proctologic field

This board is a nonprofit organization. All fees will be used, after a reasonable amount is set aside for necessary expenses in maintaining its office conducting examinations, etc., to aid in improving existing opportunities for the training of the surgeon

#### CERTIFICATE

A certificate attesting to a candidate's qualification in surgery after meeting the requirements will be issued by the board, having been signed by its officers

#### REVOCATION OF CERTIFICATE

Any certificate issued by the board shall be subject to revocation by the board at any time in case it shall determine in its sole judgment that a candidate who has received a certificate, either was not properly qualified to receive it or has become disqualified since its receipt

Proper forms for making application and other information will be furnished by the secretary

#### ORGANIZATION

At the annual meeting of the American Association of Genito-Urinary Surgeons held at Niagara Falls Ont. Canada May, 26-28, 1932 Dr. William F. Braasch called attention to the various qualification boards which had been established or were in the process of being established for the certification of specialists. He suggested that a committee should be appointed from this organization to investigate the advisability of establishing a similar board for the specialty of urology. A committee consisting of Dr. Braasch as Chairman, Dr. Henry G. Bugbee and Dr. Hugh H. Young was appointed. This committee reported to the society in 1933, was reappointed to continue its efforts and was given the power to act

At the meeting of the American Urological Association in 1933 Dr. George R. Livermore in his presidential address suggested that all candidates for specialization in urology should have some definite preparation and should be required to take a thorough examination before being recognized as specialists in urology. Dr. Livermore appointed Dr. Joseph F. McCartin chairman. Dr. George Gilbert Smith and Dr. Herman L. Kretschmer as a committee to study this suggestion

At the annual meeting of the American Medical Association in Milwaukee, June 12-16, 1933 a committee consisting of Dr.

Montague L. Boyd, chairman, Dr A. I. Folsom and Dr Frank Himman was appointed to cooperate with similar committees from the American Association of Genito-Urinary Surgeons and the American Urological Association in the establishment of the American Board of Urology.

The first combined meeting of the committees from these three organizations was held on Oct. 11, 1933, in Chicago. Dr. Herman L. Kretschmer was made president, Dr. Joseph F. McCarthy, vice president, and Dr. William F. Brunsch, secretary. These men were elected to serve as temporary officers. A permanent organization could not be effected, however, because the committee from the American Urological Association had not been given the power to act.

The second meeting of these committees was held in New York City, Feb. 2, 1934. Dr. Nathaniel P. Rathlum, president of the American Urological Association, was present at this meeting.

At the annual meeting of the American Urological Association held in Atlantic City, N. J., May 22-24, 1934, the committee reported the activities of the temporary "Board of Urology." This report, which contained suggestions for the guidance of future committees from this association, was accepted, and a new committee was elected by the association, and was given the power to act.

The permanent "American Board of Urology, Inc.," was organized at Chicago, Sept. 24, 1934. The committee members present from the American Association of Genito-Urinary Surgeons were Dr. William F. Brunsch, Dr. Henry G. Bugbee, and Dr. Gilbert J. Thomas; those from the American Urological Association were Dr. Nathaniel P. Rathlum, Dr. Herman L. Kretschmer, and Dr. George Gilbert Smith; those from the Section on Urology of the American Medical Association were Dr. A. I. Folsom, Dr. I. Leon Howard, and Dr. Clarence G. Bandler.

The officers of the board elected at this meeting were Dr. Herman L. Kretschmer, president; Dr. Clarence G. Bandler, vice president; Dr. Gilbert J. Thomas, secretary-treasurer.

The board was incorporated May 6, 1935, and held its first legal meeting May 10, 1935.

#### PURPOSES

The first objective of the American Board of Urology, Inc., is to render better service to the public by insuring the competence of any physician or surgeon who is specializing, or who wishes to specialize, in the field of urology. It will elevate the standards and advance the cause of urology. It will investigate the curricula of medical schools, and will encourage adequate facilities for graduate instruction in urology.

#### FUNCTIONS

(a) The board will arrange to control and conduct examinations testing the qualifications of volunteer candidates.

(b) The board will grant and issue certificates or other evidence of special knowledge in the field of urology to voluntary applicants or to candidates for certification.

(c) The board will endeavor to serve the public, hospitals, medical schools, medical societies and practitioners of medicine and surgery by preparing lists of urologists whom it has certified.

#### LIMITATIONS OF FUNCTIONS

The conferring of degrees, "Doctor of Medicine" or "Bachelor of Medicine" remains with the universities, where it belongs, and this board makes no attempt to control the practice of urology by license, or legal regulations. This board does not intend in any way to interfere with or limit the professional activities of any duly licensed physician.

#### REASON FOR APPLYING FOR A CERTIFICATE, ITS VALUE

The American Urological Association, the American Association of Genito-Urinary Surgeons, and the Section on Urology of the American Medical Association are interested in furthering the cause of urology and have participated in the formation of this board. They are sponsoring its activities. The various national medical societies, the public, hospital directors and others, will utilize the certification from this board as a means of discriminating between those well grounded as specialists in urology, and those who are not.

Lists of individuals who have certificates from this board, and who are engaged in the practice of urology may be published in the Directory of the American Medical Association and will be published in a booklet issued from time to time by the American Board of Urology, Inc. The directory of the

American Medical Association may indicate, by symbols in the biographical data, those whose names are eligible to appear on the list of diplomates of this board.

Application for this certificate is purely voluntary. There is only one type of certificate. No indication is given as to whether or not the candidate received his certificate with or without examination. All certificates are identical.

The Advisory Board for Medical Specialties working in conjunction with, and reporting to, the Council on Medical Education and Hospitals of the American Medical Association, has set certain standards of preparation for specialization which the American Board of Urology, Inc., wishes to adopt. The advisory board has drawn from the experience of all the present functioning boards, and has been of inestimable assistance in the formulation of the Constitution and By-Laws for the Board of Urology. Other organizations which now successfully operate boards of certification are:

The American Board of Ophthalmology, the American Board of Otolaryngology, the American Board of Obstetrics and Gynecology, the American Board of Dermatology and Syphilology, the American Board of Pediatrics, the American Board of Psychiatry and Neurology, the American Board of Radiology, the American Board of Orthopedic Surgery, the American Board of Internal Medicine, the American Board of Pathology and the American Board of Surgery. Among the organizations cooperating with the Advisory Board for Medical Specialties are the Association of American Medical Colleges, the American Hospital Association, the Federation of State Medical Boards of the U. S. A., and the National Board of Medical Examiners.

#### APPLICATION BLANK REQUIREMENTS FOR ALL APPLICANTS

Application for certification must be made on a special blank. This will be provided by the secretary and must be returned to him accompanied by other required data and credentials, and by \$15 of the examination fee.

Requirements for Applicants (Article VIII, Section 2, of the By-Laws of the American Board of Urology, Inc.)

Each applicant, before he shall become eligible to take the examination for certification in urology, must:

A. Have graduated from a medical school of the United States or Canada recognized by the Council on Medical Education and Hospitals of the American Medical Association, and must have completed an internship of not less than one year in a hospital approved by the same council. (The former requirement is not applicable to a candidate who graduated from an institution now extinct, or whose graduation occurred before the American Medical Association had prepared a list of accredited medical schools.) All graduates of foreign medical schools must obtain a license in the state in which they propose to practice medicine and the certificate of the National Board of Medical Examiners before making application for certification.

B. Establish in a manner satisfactory to this board that he is a physician duly licensed by law to practice medicine, that he is of high ethical and professional standing and that he has received adequate special training in urology.

The board is attempting to increase and to standardize the facilities for urological training in teaching institutions, so that the expression "special training in Urology" may be interpreted to include:

1. A period of study, after the internship, of not less than three years in clinics, dispensaries, hospitals or laboratories recognized by the Council on Medical Education and Hospitals of the American Medical Association as competent to provide a satisfactory training in the special field of Urology.

This period of specialized preparation should include:

(a) graduate training in anatomy, physiology, pathology, and the other basic medical sciences which are necessary to the proper understanding of the disorders and treatment involved in the specialty of Urology.

(b) an active experience of not less than eighteen months in hospital clinics, dispensaries and diagnostic laboratories recognized by the Council on Medical Education and Hospitals of the American Medical Association as competent in the diagnosis and treatment of urologic conditions.

(c) examinations in the medical sciences basic to the specialty of Urology, as well as in the clinical laboratory and public health aspects of urology in the city from which he makes application.

2. An additional period of not less than two years in the private practice of urology in the city from which he makes application. These special requirements conform with the suggestions made by the Council on Medical Education and Hospitals of the American Medical Association.

C. Make application to the American Board of Urology, Inc., whose duty it shall be to investigate the applicant's credentials and make a survey of his character.

D. Assure the board that he is engaged in the practice of urology and that he intends to continue to be so engaged.

E. Membership in the American Medical Association, or comparable national medical society, is recommended.

## FEE

The examination fee will be \$75. Fifteen dollars must accompany the application. Sixty dollars is to be paid when the applicant is accepted as a candidate for certification. This is the total expense to the candidate. If a candidate fails in his examination, he will be permitted a second examination after one year, or within three years, without additional fee, but he must give sixty days notice of his intention to appear for reexamination. After an applicant has failed twice he must file a new application blank accompanied by a second fee. If an applicant is lacking in any of the requirements as stated above he will be considered ineligible for examination and classification and his fee will be returned. In no other instance, however, will a refund of the examination fee be possible.

## REQUIREMENTS FOR CERTIFICATION

According to the By-laws of the American Board of Urology, Inc., applications received from applicants for certification shall be examined by the Credentials Committee and reviewed by the board. When additional data are required to complete the application, these will be requested by the secretary's office.

The requirements for certification include: personal appearance before the board, preparation of fifty case reports of major urological cases under the candidate's own supervision which must contain all items essential for diagnosis, therapy, prognosis, results of treatment, etc.; oral and clinical examinations; written examinations.

In specific instances, the board may waive any part of these requirements with the exception of the item of personal appearance.

Each candidate will receive a notice of the time and place of the examinations, and an appointment for his personal appearance before the board.

## EXAMINATIONS, WHERE HELD, AND REPORTS OF CASE HISTORIES

The board will hold one examination a year. This will be held at a time or place that the board may select or deem expedient.

1 The *written examinations* are designed to test the candidate's preparation in, and his knowledge of, the whole subject of urology, including the fundamental subjects: pathology, anatomy, physiology, embryology, bacteriology, physiological chemistry and endocrinology. The examination in pathology will consist of the identification of gross specimens and of sections of tissue observed through the microscope. The examination in anatomy, physiology, embryology, bacteriology, physiological chemistry, and endocrinology will be a test of the candidate's working knowledge of these subjects as they are related to the practice of urology.

2 The oral and clinical examinations will consist of discussions of common urologic conditions. The subjects forming the basis of the oral examinations are urography, diseases of the genital organs, including the prostate, diseases of the urinary bladder, and diseases of the ureters and kidneys. The oral examination may deal directly with the reports of case histories which the candidate has submitted. This examination will ascertain the candidate's familiarity with recent urologic literature, the breadth of his clinical experience and his general qualifications as a specialist in urology. The applicant also will be examined in 'professional adaptability' in an attempt to ascertain his attitude toward his fellow practitioners and his patients.

3 The *reports of fifty major urological cases* must be consecutive and must have been under the candidate's own supervision. They must not be abstracted. Sufficient data should appear in these so the examiner will know that a proper history was taken and that a thorough examination, including a complete physical survey, was made.

Case reports that are copied verbatim from a hospital record are not desired. They must be identified by the name of the hospital and the case admission numbers with the pertinent dates. The reports must be typewritten (on 8½ by 11 inch paper) and in duplicate but need not be on any special forms.

The data should be placed under proper headings and the arrangement of these should conform to the sequence of events incidental to the patient's admission to the hospital or clinic. The examinations made and treatment prescribed.

Each candidate must assume personal responsibility for the data in his case reports, including autopsy findings and interpretations of urograms. If the reports are prepared by record clerks, interns, or fellows, they should be reviewed by the candidate and careful attention given to the spelling and the correct use of medical terms before submitting them to the secretary of the board. Case reports are documentary evidence of a candi-

date's method of practice, and the data in them and the manner in which these are presented reflect this.

Satisfactory case reports must be submitted before a candidate will be permitted to continue with other parts of his examination. If case reports are pronounced unsatisfactory by more than one examiner the candidate will be informed of this and requested to prepare others. Criticisms and unsatisfactory reports will be sent to the candidate upon request.

Case report must be submitted to the secretary of the board at least ninety days before the time set for the oral-clinical examination.

Although the board requires that all the essential points of the history and examination be given as well as a complete description of the surgical procedure, emphasis should be placed on the following items: preoperative diagnosis, clinical and pathological diagnosis, summary of postoperative course with special reference to morbidity, clinical findings at time of discharge from the hospital and subsequent 'follow-up' reports.

A short paragraph must be prepared for each case by the candidate. These data must include the candidate's interpretation of the history in terms of pathology, the basis for the diagnosis, the facts that determined the treatment prescribed, whether surgical or otherwise, the course of treatment to be pursued following discharge from the hospital or clinic, a critical discussion of the knowledge gained from the proper handling of the case or from the errors made (if any) in the diagnosis and method of treatment.

Complete separate index lists of the case history reports submitted must accompany the records. If the reports are obtained from more than one hospital they must be consecutive, as mentioned before, and a separate complete index list of each group of reports must be provided. These lists must state the operator's name at the head of each page, the name of the patient, the hospital and admission number and the date of operation. The lists will be filed in the secretary's office for verification purposes.

Case report will be reviewed by examiners living in localities other than those where the candidates practice.

## FINAL ACTION

Final action is based on the applicant's training, his professional record, his attainments in the field of urology, and the results of the examinations. Any well trained urologist will have no difficulty in obtaining the board's certification. This board is organized not to prevent qualified urologists from obtaining certificates but to assist them in becoming recognized in their communities as men competent to practice in the special field of urology.

The activities described above proceed from the certificate of incorporation in which is stated the nature of the business, objects and purposes proposed to be transacted and carried out by this corporation.

## REVOCATION OF CERTIFICATE

Certificates issued by this board are subject to the provisions of the Articles of Incorporation and the By-laws. According to Article IX, Section 4 of the By-laws, each certificate may be revoked in the event that:

(a) The issuance of such certificate or its receipt by the physician so certified shall have been contrary to or in violation of any provision of the Certificate of Incorporation of this the American Board of Urology, Inc. or of the By-laws; or

(b) The physician or party certified shall not have been eligible to receive such certificate, irrespective of whether or not the facts constituting him so ineligible were known to or could have been ascertained by the directors or the board at the time of the issuance of such certificate; or

(c) The physician or party so certified shall have made any misstatement of fact in his application for such certificate or in any other statement or representation to the board or its representatives; or

(d) The physician so certified at any time while continuing to practice shall cease to practice urology; or

(e) The physician so certified shall at any time have neglected to maintain the degree of competency in the practice of the specialty of urology as set up by the board and shall refuse to submit to reexamination by the board.

The Board or Trustees of this Corporation shall have the sole power jurisdiction and right to determine and decide whether or not the evidence or information before it is sufficient to constitute one of the grounds for revocation of any certificate issued by this corporation and the decision of such Board or Trustees in the premises shall be final.

Communications should be addressed to the secretary treasurer.

## ADVISORY BOARD FOR MEDICAL SPECIALTIES

Organized 1933-1934 to coordinate graduate education and certification of medical specialists in the United States and Canada

This board reports directly to its member groups, and functions in close cooperation with the Council on Medical Education and Hospitals of the American Medical Association and with the Advisory Council on Medical Education

The work of this Board has been aided by grants from the Josiah Macy Jr Foundation of New York, but the Board is now supported by its component groups

### FOREWORD

The Advisory Board for Medical Specialties has prepared these data for the purpose of furnishing general information regarding its activities in connection with graduate medical education and the certification of medical specialists in the United States and Canada. It is designed also to give detailed

information concerning the procedure to be followed by examining boards in the various specialties in order to obtain membership in this Advisory Board and official recognition by the Council on Medical Education and Hospitals of the American Medical Association. This information is based in large part on the experience of previously formed boards during the past twenty-five years.

### ORGANIZATION

This Advisory Board was organized in 1933-1934 to coordinate graduate education and certification of medical specialties in the United States and Canada.

Several specialty boards had been functioning actively and successfully for a number of years prior to the organization of the Advisory Board for Medical Specialties. Their purposes were, primarily, to establish minimum standards of graduate educational and training requirements for physicians representing themselves to the public as being specialists, with certification by the boards of candidates after they had been able successfully to pass the boards' examinations. Secondly, these boards hoped to improve the general standards of graduate medical education and facilities for special training. This aim is being steadily and rapidly accomplished.

Credit for the improvement in undergraduate medical education, so noticeable in this country during the past twenty-five years, is due to the efforts of universities, educational foundations, medical schools, medical societies, and to public support along these lines. The same is true of the present transition in graduate education in the specialties, sharply stimulated by the establishment and activities of these certifying boards.

The American Board of Ophthalmology was the first special certifying board to be created in 1916, the American Board of Otolaryngology, established in 1924, was followed by the American Board of Obstetrics and Gynecology in 1930, and the American Board of Dermatology and Syphilology in 1932.

During part of this period of time plans for the organization of similar boards in other specialties were being actively projected, all of these groups being desirous of availing themselves of the experiences of the already existing boards.

It was soon recognized that some formal and official plan of organization must be established. It was clearly essential that an examining board must have the official sanction of the national societies in its given specialty as well as that of its section of the American Medical Association, but there was, at that time, nothing to prevent unofficial groups from organizing examining boards and using the title American Board.

Consequently, in order to avoid duplication of effort as well as to coordinate the work of the several boards and other interested groups into a concise and homogeneous plan for betterment, it was deemed advisable to create an Advisory Board which should give consideration to those problems common to all, and which should be representative of each organization concerned.

During the years 1933 and 1934 this Advisory Board was organized and began actively to function. Simultaneously at the Milwaukee session of the American Medical Association in 1933 a resolution was adopted authorizing the Council on Medical Education and Hospitals (1) to formulate standards of administration based in general upon those of the American Boards of Ophthalmology, of Otolaryngology, of Obstetrics and Gynecology, and of Dermatology and Syphilology and, (2) to recognize officially new boards meeting these standards, this recognition to be based upon previous approval and recommendation to the Council by the Advisory Board.

A constitution and by-laws for the Advisory Board was adopted at a meeting in Chicago on February 11, 1934. The original member organizations of the Advisory Board for Medical Specialties were the Association of American Medical Colleges, the American Hospital Association, the Federation of State Medical Boards of the U S A, the National Board of Medical Examiners, the American Board of Ophthalmology, founded 1916, the American Board of Otolaryngology, founded 1924, the American Board of Obstetrics and Gynecology, founded 1930, and the American Board of Dermatology and Syphilology, founded 1932. Two representatives were appointed from each of these organizations to serve on the Advisory Board. Since that time the American Board of Pediatrics (1934), of Psychiatry and Neurology (1934), of Radiology (1934), of Orthopaedic Surgery (1934), of Urology (1934), of Pathology (1936), of Internal Medicine (1936), of Surgery (1937), of Anesthesiology (1938), of Plastic Surgery (1938), and of Neurological Surgery (1940) have been properly organized, approved, and elected to membership in the Advisory Board and recommended to the Council on Medical Education and Hospitals of

the American Medical Association for official recognition. There are, therefore, fifteen examining boards now organized, approved and actively functioning in the fifteen specialties recognized as suitable fields for the certification of specialists.

The work of this board has been aided by grants from the Josiah Macy, Jr., Foundation of New York, but the board is now supported by its component groups.

#### PURPOSE

Article II of the Constitution states that, "This board shall act in an advisory capacity to such organizations as may seek its advice concerning the coordination of the education and certification of medical specialists." Specifically, this represents an official effort to advance the standards and improve the methods of graduate education and training in the medical specialties with certification of men thus educated and trained who qualify as specialists in the various branches. The common interest of the member organizations in these purposes is obvious. It is equally apparent that some fixed definition of specialties needed to be established, preferably on a graduate educational basis, that minimum standards of organization and conduct for new examining boards should be fixed, and that some official method of recognition be developed.

There is no desire on the part of these boards to interfere with any practitioners of medicine in any of their regular or legitimate activities. Their fundamental purpose is to ensure to the public, both lay and medical, and for its protection that physicians claiming to be specialists with presumably special proficiency in one or another branch of medicine actually possess the qualifications they claim. This presupposes special training and demonstrable capability along certain lines of work. Suitable evidence of this is the ability of an individual to satisfy an examining board about his training and then to pass the examination for certification.

Surveys of existing facilities for graduate training in the various specialties are being conducted at the present time. Residences as well as preceptorship and assistantship training are being studied. Preparations for stimulating medical school and hospital facilities for the required graduate training are going forward actively. Round table conferences furnish discussions of subjects of interest in regard to graduate medical education.

The Council on Medical Education and Hospitals of the American Medical Association has agreed, under the authority vested in it by the resolution passed at the Milwaukee meeting (1933) and referred to above, that applications of special examining boards for official approval are to be referred to the Council through the Advisory Board for Medical Specialties, recommendation by the Advisory Board for such approval to be based upon the standards mutually adopted. The understanding exists that the Council cannot be bound by recommendations of the Advisory Board but will consult the Advisory Board for Medical Specialties before acting upon any application so long as mutually adopted standards are in force.

Early in 1940 there was published the first edition of the Directory of Medical Specialists containing the names and biographic data of all men certified by the several specialty boards, as well as information regarding the organization and functions of these boards. In the last edition published early in 1942 appears the names and brief biographic records including hospital and teaching appointments, of about 18,000 diplomates or certified specialists.

In response to the generally recognized need for a clear formulation of the educational problems and principles involved in graduate and postgraduate medical training, the Advisory Board at its meeting in June 1937 voted to create a Commission on Graduate Medical Education to study the various aspects of the whole problem. This commission included representatives of the profession, the specialties, the universities, the hospitals, and the licensing bodies. The report of this commission comprising 304 pages appeared in 1940, published by the University of Chicago Press and is of real assistance to the various specialty boards, hospitals, medical schools, and regulatory bodies dealing with this phase of American medicine.

#### MEMBERSHIP

The Advisory Board is composed of two representatives from each of the approved examining boards in the medical specialties and such other national organizations as are interested in education, examination, and certification of medical specialists and duly elected to this body.

The Constitution provides that, "To be eligible for representation in this board an examining board in a specialty must be composed of members elected from or appointed by societies

recognized by this board as a national society in that specialty together with representation from the related section of the American Medical Association." Upon being accepted by the Advisory Board the board in question is recommended to the Council on Medical Education and Hospitals of the American Medical Association as qualified for recognition. Membership in the Advisory Board provides for the inclusion of the name of the organization in all lists and directories published by the Advisory Board for Medical Specialties and provides also for publication of the names of specialists certified by each individual examining board.

This board reports directly to its member groups, and functions in close cooperation with the Council on Medical Education and Hospitals of the American Medical Association, and with the Advisory Council on Medical Education.

The Advisory Board has voted that no more subsidiary boards be formed and that further special groups be provided for so far as possible, within the boards of medicine and surgery.

Meetings of the Advisory Board for Medical Specialties are held annually as required.

Traveling and other expenses of representatives in attendance are borne by member organizations.

#### ESSENTIALS FOR APPROVED SPECIAL EXAMINING BOARDS

##### I ORGANIZATION

1 A special examining board to be approved by the Advisory Board for Medical Specialties should represent a recognized and distinct specialty of medicine. (It is agreed between the Council and the Advisory Board that no board shall be organized in a special field having less than one hundred members engaged in special practice in the United States.)

2 It should be composed of representatives of the national organizations in that specialty including the related section of the American Medical Association.

3 It should be incorporated.

4 A special board should

(a) Determine whether candidates have received adequate preparation.

(b) Provide a comprehensive test of the ability and fitness of such candidates.

(c) Certify to the competence of those physicians who have satisfied its requirements.

##### II DEFINITION OF SPECIAL FIELDS

The following branches of medicine at present are recognized as suitable fields for the certification of specialists:

- 1 Internal Medicine
- 2 Surgery
- 3 Pediatrics
- 4 Obstetrics and Gynecology
- 5 Ophthalmology
- 6 Otolaryngology
- 7 Dermatology and Syphilology
- 8 Psychiatry and Neurology
- 9 Urology
- 10 Orthopaedic Surgery
- 11 Radiology
- 12 Pathology
- 13 Neurological Surgery
- 14 Anesthesiology
- 15 Plastic Surgery

##### III QUALIFICATION OF CANDIDATES

Each applicant for admission to the examination should be required to present evidence that he has met the following standards:

###### A General Qualifications

1 Satisfactory moral and ethical standing in the profession.

2 Membership in the American Medical Association or membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association is recommended. Membership in other societies should not be required. (Exceptions to the foregoing may now be made at the discretion of any individual board for good and sufficient reasons.)

###### B Professional Standing

1 Graduation from a medical school recognized by the Council on Medical Education and Hospitals of the American Medical Association.

2 Completion of an internship preferably of the general rotating type or not less than one year in a hospital approved by the same Council.

###### C Special Training

(To be effective as far as practical not later than Jan. 1 1944)

1 A period of study, after the internship, of not less than three years in clinics, dispensaries, hospitals or laboratories recognized by the same Council as competent to provide a satisfactory training in the special field of study

2 This period of specialized preparation should include

(a) Graduate training in anatomy, physiology, pathology, and the other basic medical sciences which are necessary to the proper understanding of the specialty in question

(b) An active experience of not less than eighteen months in hospital clinics, dispensaries and diagnostic laboratories recognized by the Council as competent in the specialty

(c) Examinations in the basic medical sciences of a specialty as well as in the clinical, laboratory and public health aspects

3 An additional period of not less than two years of study and/or practice

These essentials were adopted by the Advisory Board for Medical Specialties June 10, 1934 and have had only minor changes since then. They are practically identical with an outline of Essentials for Approved Specialty Boards adopted June 10, 1934 by the Council on Medical Education and Hospitals of the American Medical Association and ratified June 11, 1934 by the House of Delegates of the American Medical Association

#### ORGANIZATION OF EXAMINING BOARDS

The foregoing essentials for approved special examining boards were followed in the organization of the existing boards

Official sponsorship of the national societies, and the related section of the American Medical Association, in a specialty organizing an examining board, has included the election or appointment of representatives from each of these national societies to serve on the board as examiners and directors

Each board was or is incorporated. Each application for organization and approval included

1 The name of the proposed board

2 A statement of its method of organization, the sponsoring societies, its list of officers, and the names and addresses of the elected or appointed members of the board, including the societies which each represents

3 A copy of the tentative constitution and by-laws

4 A copy of its proposed articles of incorporation

5 An outline of qualification requirements for applicants

6 An outline of proposed methods of examination

7 A copy of the application blank

8 Any general information or statement of importance

9 Approximate number of physicians practicing the specialty which the board represents

These data are submitted in duplicate to the office of the Secretary of the Advisory Board for Medical Specialties. An application for election to membership in the Advisory Board and the data listed above are referred immediately for review by the Committee on Standards and Examinations of the Advisory Board. Upon approval by the committee incorporation is then completed and a statement of this filed with the secretary. Action on the application will be taken at the succeeding meeting of the Advisory Board for Medical Specialties and each examining board as elected will be recommended to the Council on Medical Education and Hospitals of the American Medical Association for official recognition. One of the two sets of data submitted is forwarded to the Council on Medical Education and Hospitals of the American Medical Association with the Advisory Board's recommendations. Examination and certification of applicants in the specialty may begin immediately when the special board is given such approval. Communications should be addressed to the secretary

#### CONSTITUTION AND BY-LAWS

*Adopted at Organization Meeting, February 11, 1934*

##### ARTICLE I

###### NAME

The name of this organization shall be "The Advisory Board for Medical Specialties"

##### ARTICLE II

###### PURPOSE

This board shall act in an advisory capacity to such organizations as may seek its advice concerning the coordination of the education and certification of medical specialists. No action taken by this Board shall be binding upon any member organizations

##### ARTICLE III

###### MEMBERSHIP

###### Section I

This board shall be composed of two representatives from each of the examining boards of the medical specialties and such other national organizations as are interested in education, examination, or certification of medical specialists

###### Section II—Original Membership

At the time of the organization, this board shall be composed of representatives from each of the following bodies

The American Board of Ophthalmology

The American Board of Otolaryngology

The American Board of Obstetrics and Gynecology

The American Board of Dermatology and Syphilology

The Association of American Medical Colleges

The National Board of Medical Examiners

The Federation of State Medical Boards of the U S A

The American Hospital Association

The Council on Medical Education and Hospitals of the American Medical Association

###### Section III—Additional Membership

To be eligible for representation in this board an examining board in a specialty must be composed of members elected from or appointed by societies recognized by this board as national societies in that specialty together with representation from the related Section of the American Medical Association. Upon being accepted by this Advisory Board the board in question will be recommended to the American Medical Association as being qualified for recognition by that Association

###### Section IV—Quorum

A quorum at any meeting shall consist of a majority of the official representatives to the board and at least one third of the membership organizations shall be represented. Each member organization shall be entitled to two votes

#### ARTICLE IV

##### OFFICERS AND STANDING COMMITTEES

###### Section I—Officers

The officers of this board shall be (a) President, (b) Vice President, (c) Secretary Treasurer. These officers shall be elected at the annual meeting each year

###### Section II—Standing Committees

The standing committees shall be as follows

1 The Executive Committee

2 Standards and Examinations

3 Finance

The Executive Committee shall consist of the President, Vice President, Secretary Treasurer, and two members elected at the annual meetings. No organization should have more than one member on the Executive Committee. The President shall be the Chairman of the Executive Committee. The other standing committees shall be appointed by the President

#### ARTICLE V

##### AMENDMENTS TO THE CONSTITUTION

Amendments to this constitution may be made by a majority vote of the official representatives present at any annual meeting provided that thirty days' notice of the proposed amendment has been given each member of the board

#### BY-LAWS

##### ARTICLE I

###### DUTIES OF OFFICERS

###### Section I

The President shall preside at all meetings of the board, shall act as Chairman of the Executive Committee, and shall appoint all other standing committees. He shall call meetings of the Executive Committee at such time and place as may be deemed necessary

###### Section II

The Vice President shall assume the duties of the President in his absence

###### Section III

The Secretary Treasurer shall perform the usual duties of this office

##### ARTICLE II

###### EXECUTIVE COMMITTEE

The Executive Committee shall carry out the policies and activities decided upon by the board. It shall have ad interim authority to initiate policies subject to approval by the board at the annual or any special meeting. The two elected members shall serve for two years, the terms of office terminating in alternate years

##### ARTICLE III

###### MEETINGS

###### Section I

There shall be an annual meeting at such time and place as the board may determine. A special meeting may be called by the president upon ten days' notice to all members stating time, place and purpose of such meeting. The Executive Committee may present other business for consideration

###### Section II

The Executive Committee shall meet subject to the call of the President

###### Section III

Robert's Rules of Order shall be followed except where they conflict with this Constitution and By Laws

##### ARTICLE IV

###### AMENDMENTS TO THE BY LAWS

Amendments to these by laws may be made at any regular or special meeting of the board

## CONTRIBUTION OF MEDICAL SCHOOLS TO THE WAR EFFORT

An educational institution is never better than its faculty. Regardless of physical and clinical facilities a medical school cannot offer opportunities for a high standard of medical education without a competent faculty to assume leadership, offer stimulus and maintain supervision over the work of its students.

As a war measure the medical schools of this country have increased the size of their entering classes by approximately 10 per cent. They have adopted an accelerated program which calls for the graduation of a class every nine months. They have been asked to make available for military service all members of their faculties except those who are absolutely essential for the conduct of their programs. The request is reasonable and is a contribution which the medical schools can and should make to the conduct of the war.

The medical schools have been asked not to lower the standards of medical education in connection with the adoption of the accelerated program or the increase in size of the student body. Competent teachers are rare, and relatively few members of a medical school faculty, valuable as they may be in assisting in the conduct of the school's program, are competent to assume major teaching responsibilities. All too prevalent is the idea that a teacher does not need special qualifications and that in a medical school any one with an M.D. degree may serve as a competent teacher. Hence many apparently believe that any member of a medical school faculty who happens to be disqualified for military service either because of age or because of physical condition is competent to replace any other man in his department who is deemed essential by the school but who otherwise meets the qualifications for military duty. It is competent teachers that are essential rather than simply manpower, if the medical schools are to meet satisfactorily the responsibilities they have assumed in connection with graduation of over twenty-one thousand qualified physicians during the next three years.

Medical teachers who are essential to the conduct of the medical school must appreciate their responsibility

to continue in their teaching positions. Furthermore, they should realize that by so doing they are making a great contribution to the war effort in the education of this unprecedented number of physicians, which is necessary to the continued conduct of the war. In many instances they will be called on to carry a much heavier routine and to make greater sacrifices as teachers than they would as commissioned officers in the military services. Enthusiasm for service, local attitudes and social pressure have already resulted in serious depletion of the medical school faculties in a few instances.

Mutual cooperation between the Office of Procurement and Assignment of Physicians, Dentists and Veterinarians and the medical schools should provide a reasonable allocation of responsibilities for the faculties of the medical schools. Only through such cooperation can the medical schools meet both their immediate and their continuing responsibilities in providing their share of physicians for the entire war effort.

## THE HEALTH OF MEDICAL STUDENTS

The importance of health in wartime has justly been stressed not alone by public health officials but by all governmental agencies. Extensive programs have been developed to protect the health of those in the armed forces and in war industries. The physicians of our country have a tendency to neglect their own health, as a national duty they must now do everything possible to protect it so that the medical profession may serve during this period with the highest efficiency.

Medical educators have for years been concerned because of the frequent "physical breakdowns" among the medical students of this country. With the adoption of the accelerated program of medical education, students will be called on to accomplish in three years what previously has caused many breaks in health when spread over a period of four years. Thus it is especially appropriate at this time to emphasize that medical schools should do everything possible to protect the health of their students, not alone in the best interest of students themselves, but as a part of the responsibility which the medical schools are assuming in preparing these young men to serve efficiently as physicians either with the armed or with the civilian forces.

Student health services in this country have been successful in discovering physical defects. The criticism is frequent that they do little to remedy such defects.

Reports from army physicians suggest that a similar criticism may be applied to medical school health services. One army medical officer recently reported that 41 per cent of two hundred and forty-five third and fourth year students from five different medical schools were disqualified for army service because of remediable defects. Medical students have been permitted by the federal authorities to continue their education in order that they may enter the military services as

qualified physicians. The medical schools have for the same reason sought the deferment of these students and have assumed the responsibility of preparing them for such service. The medical school and the medical student should cooperate to secure correction of remediable defects. Then as far as possible the graduates of our medical schools will be both physically and mentally qualified to meet their responsibilities.

### ARTIFICIAL ANTIBODIES

In vitro synthesis of type specific antipneumococcus precipitins and agglutinins has been reported recently by Pauling and Campbell<sup>1</sup> of the Department of Chemistry, California Institute of Technology. Substances simulating specific antibodies formed outside the animal body were demonstrated thirty years ago by Russian immunologists Ostromyschlenski and Petroff,<sup>2</sup> for example, incubated a mixture of diphtheria toxin and normal horse serum and obtained an end product with all the therapeutic properties of diphtheria antitoxin. By incubating diphtheria toxin with different protein fractions of normal horse serum, Kryshanowski<sup>3</sup> prepared two artificial diphtheria antitoxins of different therapeutic value. By somewhat different techniques, Sdrawosmisslow<sup>4</sup> and Kimmelstiel<sup>5</sup> incubated diphtheria toxin with commercial trypsin and reported the successful test tube synthesis of a "toxin trypsinate" with the therapeutic properties of an antidiphtheritic serum. In anticipation of future commercial value, artificial antitoxin made by incubating diphtheria toxin with normal serum plus pancreatin was promptly patented in Germany.<sup>6</sup>

By substituting bacteria for diphtheria toxin, other Soviet investigators<sup>7</sup> successfully synthesized specific agglutinins, bacteriolysins and complement deviating antibodies. This technic was promptly appropriated by German botanists,<sup>8</sup> mainly to avoid the trouble and expense of experimental animals. They incubated plant juices with normal serums and reported the production of artificial precipitins, interchangeable with natural immune precipitins, in their study of biochemical plant relationships. While most of these artificial precipitins were of low titer, Sasse<sup>9</sup> obtained an occasional product with which plant juices could be identified in dilutions as high as 1:6,400. Many unexpected overlapping specificities, however, were reported by other investigators,<sup>10</sup> suggesting plant relationships differing from those suggested by natural immune serums.

The first artificial precipitin for an animal protein was prepared by Kabelik<sup>11</sup> of Czechoslovakia. He, however, believed that his synthetic product was not a true antibody but only a biochemical precursor of such an antibody. This conclusion was confirmed by Manwaring,<sup>12</sup> who found that artificial precipitins formed by incubating one part of horse protein with twenty parts of normal rabbit serum usually show zone reactions and other qualitative differences from natural immune precipitins. He concluded that "hybridization" of horse proteins in artificial serum mixtures represents but the initial stage in the natural production of specific antibodies, necessitating the assumption of secondary and tertiary stages in the natural synthesis. It also seemed necessary to assume a continuous, quasiproliferative process in order to account for the relatively high titer in experimental animals. This proliferative process was conceivably similar to the quasiproliferation of bacteriophage in symbiosis with bacterial cells.

Subsequent advances in immunochemistry, particularly determination of the chemical nature of haptens and protein molecules, have made possible today the formulation of a more definite theory. Pauling,<sup>13</sup> for example, called attention to the fact that globulin molecules are "unfolded" or "uncoiled" under the influence of certain physical or chemical agents much in the way a fern leaf uncoils on approaching maturity. On removal of these conditions the unfolded molecule is again "coiled" to its original surface specificity. Pauling assumes that in the presence of a foreign antigen the refolding is atypical, the globulin molecule coiling around and assuming a surface configuration "complementing the surface regions of the antigen." Dissociated from the adherent antigen, the refolded globulin now functions as a specific antibody or specific receptor for the antigen. Artificial antibodies therefore differ from normal serum globulins only in the way in which the polypeptide chain is refolded or recoiled. This concept is in accord with data currently reported by Wright,<sup>14</sup> who concluded that "horse antibody protein is essentially the same as horse gamma globulin."

In order to test this theory, Pauling and Campbell<sup>1</sup> attempted to prepare antibodies against antigens of known chemical composition. They selected certain antigenic dyes, for example, and type III pneumococcus carbohydrate, bovine gamma globulin being the normal serum protein used in most of their tests. Successful unfolding and refolding of gamma globulin is readily effected by several methods, such as the addition of alkali and slow return to neutrality, the addition and slow removal of urea, or by heating to 65°C and slowly cooling. Their most satisfactory yield, however, was obtained by incubating the gamma globulin-antigen

mixture for several days at 57 C, a process similar to that originally adopted by the Soviet immuno-chemists

In a typical experiment, 1 per cent type III pneumococcus polysaccharide was added to a 1 per cent solution of bovine gamma globulin and the resulting mixture held at 57 C for fourteen days. The mixture was then freed from pneumopolysaccharide by a precipitation or salting out method. The resulting free modified gamma globulin ("purified antibody") was found to precipitate type III pneumopolysaccharide in vitro but gave negative reactions with type I or type VIII polysaccharide. The modified gamma globulin would also agglutinate type III pneumococci in vitro but not types I or II. Mouse protection tests and swelling tests have not yet been carried out.

The earlier Russian attempts to synthesize specific antibodies were mainly undertaken for their theoretical interest, since substitution of relatively low titer artificial antibodies for high titer natural immune serums was of little clinical promise. With the wide use of human plasma banks at the present time, however, practical interest is aroused. If a conversion of normal human plasma globulins into immune globulins is feasible, artificial immune human plasma banks may become a subject of future clinical research. In this eventuality the California biochemists will have rendered a distinct service to clinical medicine by suggesting a definite chemical theory to replace the tentative metaphors of the earlier immunologic theorists.

## Current Comment

### GRADUATE MEDICAL EDUCATION IN WARTIME

The graduate programs of thousands of physicians in the United States are necessarily being interrupted by their call to active duty with the armed forces. However, the time spent in the service of their country cannot be considered as time lost in their preparation for future careers in any of the specialties of medicine. Military service will in many instances provide a type of training and experience which, many physicians believe, will be extremely helpful in a satisfactory preparation for the practice of the medical specialties. Furthermore, as is indicated elsewhere in this issue of THE JOURNAL, the various specialty boards have adopted certain policies in regard to granting credit for military service which will compensate at least in part for the interruption of planned programs to meet their requirements for certification. The policies adopted by the specialty boards vary from the granting of an indefinite amount of credit to be determined by an evaluation of the experience of individual applicants to full credit allowed by the American Board of Surgery for work done in the surgical division of a regularly constituted army or naval hospital. The specialty boards are not lowering their standards by the adoption of these policies

but are indicating their willingness to give such credit as is justified for experience and training gained with the armed services as well as that secured in civilian hospitals or under other accredited sponsorship. The announcement of these policies, together with the avowed intention of the Council on Medical Education and Hospitals to attempt to formulate plans to provide opportunities for the continued training of recent graduates after the war, should offer considerable encouragement to those in active service who are looking forward to careers in the medical specialties.

### TUBERCULOSIS IN INDUSTRY

Pulmonary tuberculosis is frequently ascribed to conditions of employment, often on tenuous and insecure scientific grounds. This is particularly true when employment necessitates exposure to dust, although in most instances the nature of the dust may be unknown and neither x-ray study nor physical examination made in advance of employment as a basis for comparison. Pneumonocosis to many physicians means exposure to dust (any dust) with resultant specific susceptibility to infection of the respiratory tract and activation of healed or arrested pulmonary tuberculosis. Pneumonocosis and silicosis are still synonymous in too many professional minds. Exposure to gases such as sulfur dioxide has on occasion given rise to similar faulty beliefs as to cause and effect relationships. Often investigation demonstrates contact with open unrecognized tuberculosis at home. Admittedly there are many discrepancies in our knowledge of fatigue, nutrition and recreation as factors in predisposition to the development of active pulmonary tuberculosis. Until more precise knowledge is available, however, etiologic speculation is unwarranted in all statements by physicians about this important adult health problem. Social-economic considerations lend emphasis to the need for cautious statement about the relationship between employment and tuberculosis. Conflicting and unwarranted statements offered as medical testimony before courts of law and administrators of workmen's compensation lead to much confusion and injustice. Decisions on these claims must be based on medical facts established as evidence from testimony, a difficult situation when some individual theory rather than prevailing well founded medical opinion is in the record. The remedy, obviously, is to establish all available facts relating to occupational conditions as predisposing or activating factors in pulmonary tuberculosis. The symposium on tuberculosis in industry held at Saranac Lake, N. Y., during the past year is a step in the proper direction but demands periodic repetition.<sup>1</sup> There has been some fear that chest examinations among workers will lead to the development of groups of unemployable individuals. It is allowed to deter proper clinical inquiry, it will be impossible to expect the degree of success in industrial health that has been achieved in child health. During the past twenty-five years the child health campaign has led pediatric practice largely into the field of preventive medicine.

<sup>1</sup> Gardner, Leroy L. Tuberculosis in Industry. J. A. M. A. 115: 643 (Feb. 21) 1942.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## RELATION OF EMERGENCY MEDICAL SERVICES TO INDUSTRIAL PLANTS

The Office of Civilian Defense, Washington, D C, in Medical Division memorandum number 14, points out that the primary responsibility for the protection of industrial plants rests on the operators, owners and local and state governments. The War and Navy departments have included in their program the responsibility for recommending protection in certain civilian plants engaged in the production of war material. The War and Navy departments have requested all civilian manufacturing plants having important war contracts to cooperate with the local Emergency Medical Service of the U S Office of Civilian Defense.

All industrial plants are expected to provide medical services and first aid equipment within the plant for the care of the injured. The Office of Civilian Defense recommends that each industrial plant, in addition to providing its own medical staff and first aid equipment, should plan in collaboration with the chief of Emergency Medical Services of the locality for (1) services of ambulances and emergency medical field units when needed, (2) available beds at one or more hospitals to which the severe casualties may be transported, (3) the establishment of a casualty station of the Emergency Medical Service within a short distance of the plant and (4) obtaining the services of emergency medical field units if needed to supplement the plant medical service during an emergency.

If a plant is miles from a hospital and there is a possibility that the injured might be obliged to remain at the casualty station for hours before transfer to the hospital, the casualty station should be larger than the average for a given number of employees and be adequately equipped. It must have cots, blankets, water and heating facilities and be equipped at least with the emergency medical supplies outlined in Medical Division bulletin number 2, equipment lists 1 and 2.

To implement these instructions, section V of Medical Division bulletin number 4 is amended to include the following additional duties of the local chief of Emergency Medical Service:

*During the period of preparation*

### 6 Protection of Industrial Plants

(a) Advising all employers concerning adequate emergency medical protection to be afforded within industrial, commercial and service installations, including location of casualty stations and medical supplies where needed.

(b) Arranging for direct telephone lines between important installations and control center to facilitate evacuation of casualties and to provide emergency medical service with the minimum of delay.

## ILLINOIS CIVILIAN BLOOD BANK

At the suggestion of Governor Green the state of Illinois has established a civilian blood bank, and a mobile blood collecting clinic has already collected the quota of donations for Champaign, Kane and Rock Island counties and the city of Peoria and at the time of this report was collecting blood from about sixty volunteers a day in Carbondale. The state health officer, Dr Roland R Cross, said that in every community visited by the mobile blood collecting unit the civic organizations, industries, defense councils and hospitals have cooperated. It was expected that the immediate quota of four thousand blood donations would be reached by July 25.

## AWARDS FOR SERVICE IN BURMA

The Order of the Purple Heart has been awarded to seven officers of noncombat branches of the U S Army for service in Burma. Lieut Gen Joseph W Stilwell's India headquarters announced on July 18, according to the *New York Times*. Those decorated were Major Gordon S Seagrave, Medical Corps, of Granville, Ohio, who was formerly a medical missionary in Burma, Major Donald M O'Hara of Janesville, Minn, a dentist who assisted Major Seagrave in performing operations on the porches of native dwellings in Burma, Col Adrian St John of Astoria, Queens, N Y, of the Chemical Warfare Service, who snatched "jeeps" under Japanese fire in Rangoon and put them in the hands of Chinese forces, Lieut Col Frank D Merrill of Cincinnati, Col Robert P Williams, Medical Corps, U S Army, who organized the medical service of the Fifth Chinese Army, Major Paul Jones of National City, Calif, who kept the Burma trains running when collapse threatened, and Capt John H Grundlay, Medical Corps, of Washington D C, who went to Burma from Chungking.

## INSTRUCTION IN CHEMICAL WARFARE

A course of instruction in the medical aspects of chemical warfare was given at the Los Angeles County Medical Association Building, Los Angeles, July 17-18 and again on July 24-25. While the courses were primarily intended for casualty station personnel, they were available to other interested persons also. Dr Kearney Sauer discussed the "History of Chemical Warfare," "Physical Properties of Gases," "Behavior of War Gases on Release," "Decontamination of Patients, Equipment and Materials," and "Hospital Investigation and Treatment of Gas Cases." Dr Grant H Lanphere discussed "Lung Irritants: Chlorine, Phosgene, Chlorpicrin." Drs Samuel Ayres and Maximilian Obermayer discussed "Vesicants: Mustard, Lewisite, Ethyldichlorarsine." Drs Clinton Wilson and A R Robbins, "Gas Injuries to the Eyes," and Raymond F Goudey, technical assistant gas officer, "Plans for Construction of Decontamination Stations."

## NEW YORK ORGANIZATION OF NURSES PERFECTED

The organization of New York City's trained nurses for duty in case of air raids is now perfected, with nearly six thousand nurses enrolled in field units, according to the *New York Times*. These private duty or public health nurses who have volunteered for community service are taking refresher courses weekly at hospitals as members of the Citizens Defense Nurse Corps under the Emergency Medical Service. One hundred nurses are assigned to each of fifty-four selected hospitals in the five boroughs. These mobile units of nurses will supplement emergency squads at the hospitals to which they are assigned.

## NO FIXED FIRST AID POSTS IN BUFFALO

Dr H F Brown, chief of the Emergency Medical Service in Buffalo, pointed out on June 20, according to the *Courier Express*, that casualty stations had been established in Buffalo and emergency medical field units organized. In case of emergency, teams will be sent out from these units, however, there will be no fixed first aid posts for air raid casualties in Buffalo. Field units and public and private school buildings will be used as first aid posts if necessary.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

### CALIFORNIA

**Paralysis Activities in San Francisco**—The San Francisco chapter of the National Foundation for Infantile Paralysis Inc. recently financed the expenses of the assistant professor of medicine in charge of the physical therapy department at Stanford University School of Medicine, San Francisco to attend a course on the Kenny treatment of poliomyelitis given at the University of Minnesota Medical School Minneapolis. Funds were also authorized to defray the expenses of the director of physical therapy at the Hospital for Children San Francisco, to Minneapolis to obtain training in the Kenny method of treatment for physicians, of a nurse for a week's training to be taught the technic of applications of hot fomentations and a physical therapy technician to take the two months course for such technicians. Similar expenses were authorized to defray the cost of training for limited periods for three persons holding comparable positions on the staff of the San Francisco Hospital Isolation Division.

### CONNECTICUT

**Venereal Disease Control Conference**—As a part of the national campaign to reduce venereal disease, the Federal Bureau of Investigation state and local law enforcement agencies and members of the state department of health and the state medical society participated in a conference on the control of venereal disease and prostitution. The series opened in Torrington and Hartford on July 21, and meetings were held at Norwich and New London on the 22d, at Middletown and New Haven on the 23d and at Bridgeport and Stamford on the 24th.

**Biochemist Wakeman Retires**—Alfred J. Wakeman, Ph.D. for thirty years a member of the department of biochemistry at the Connecticut Agricultural Experimental Station at New Haven, has retired. Born at Green's Farms, Dr. Wakeman received his Ph.D. at Yale University, New Haven in 1887 and his Ph.D. at Leipzig in 1894. Prior to 1912 when he joined the experimental station staff, Dr. Wakeman had served at the Massachusetts Institute of Technology, Cambridge, the Sheffield Scientific School at Yale and the Herter Laboratories in New York. According to *Science*, Dr. Wakeman was associated at the station with Osborne and Mendel in their work on the nutritive properties of proteins and in the early studies of vitamin concentrates.

### GEORGIA

**Change in Health Personnel**—Dr. Clair A. Henderson, Savannah, has resigned as assistant city-county health officer of Savannah and Chatham County to become commissioner of health of Augusta and Richmond County effective July 1. He will succeed Dr. Thomas B. Phinizy, Augusta, who recently resigned.

**Activities of New Industrial Health Committee**—The committee on industrial health of the Medical Association of Georgia, which was organized in Atlanta in May, has begun a survey of essential defense industries and related industries throughout the state with a view to inaugurating campaigns on nutrition, safety and health. The committee aims further to have appointed in connection with local medical societies a committee on industrial health in districts and cities where there are essential war industries. A program is now under way to organize health and safety commissions composed of safety directors, managers of labor or plant managers, personnel directors, plant surgeons, health officers, nutrition experts in health work and representatives of labor unions. Through this project the committee on industrial health hopes to direct education along lines of proper diet in industrial cases as well as in homes of workers and coordinate efforts to increase production by staggering hours, rest periods and prolonging periods between shift changes. The entire program of the committee on industrial health seeks to tie in with the state association's plan to improve nutrition among citizens of the state and to fight vitamin deficiencies which are widespread among the lower income groups in industry. Dr. John W. Simmons, Brunswick, is chairman of the committee, and Dr. Lester M. Putrie, Albany, in charge of the department of hygiene of the state department of health, is secretary.

### ILLINOIS

**Physician Honored**—The staff of the Veterans Administration Facility at Dwight presented a silver plaque to Dr. Rhodric W. Browne who after seven years as managing officer of the hospital there is now on the retired list. Dr. Browne was also presented with a piece of airplane luggage from the entire personnel of the hospital. Dr. Browne with his wife left July 5 for New York, where they will make their future home.

### CHICAGO

**Dr. Apfelbach Made Medical Director of Presbyterian Hospital**—Dr. Carl W. Apfelbach, Rush professor of pathology, University of Illinois College of Medicine, has been appointed medical director of Presbyterian Hospital where he has been a member of the staff since 1924. Following his graduation at Rush Medical College in 1922, Dr. Apfelbach served an internship and residency at the hospital.

**Vinzenz Mueller Dies**—Mr. Vinzenz Mueller, manufacturer of surgical instruments, died in Oak Park, June 6, of a coronary attack at the age of 77. Mr. Mueller was born in Liptingen, Germany. For some years he was apprenticed to a manufacturer of instruments in Tuttlingen. Later he went to Berlin, Paris and London to serve as foreman in manufacturers' shops. He came to America in 1893 and served for a time in Chicago as foreman for the firm of Frank and Kratzmueller. In 1895 he with his wife established a small surgical instrument business in Chicago. Mr. Mueller was a founder and past president of the American Surgical Trade Association. In 1913 he started the publication of the association's journal, assuming the entire editorial and financial responsibility himself. Mr. Mueller had been chairman of the board of V. Mueller & Company for the past six years.

### INDIANA

**Dr. Rice Named Health Education Consultant**—Dr. Thurman B. Rice, chief of the bureau of health and physical education of the Indiana State Board of Health, Indianapolis, has been named health education consultant but will continue to serve as editor of the *Monthly Bulletin* of the department. Dr. Rice will be succeeded as director of the division by Frank S. Stafford, M.S., who has been teaching health and sports in several Indiana high schools. Dr. Rice was born in Landess in 1888. He was a teacher in several schools throughout the state and from 1921 to 1924 served on the faculty of the Indiana University School of Medicine, Indianapolis, where he has been professor of bacteriology and public health since 1926. In 1924 he became associated with the state department of health as director of the laboratory of hygiene and as assistant director of public health from 1933 to 1936 when he became chief. Dr. Rice has written numerous articles and textbooks on health for children and in 1933 wrote a set of sex education pamphlets published by the American Medical Association.

### MAINE

**State Medical Election**—Dr. Stephen A. Cobb, Sanford, was chosen president-elect of the Maine Medical Association at its annual meeting in Poland Spring in June and Dr. Carl H. Stevens, Belfast, was installed as president. Dr. Frederick R. Carter, Portland, was reelected secretary-treasurer.

### MARYLAND

**New Deputy State Health Officer**—Dr. Nels A. Nelson, Baltimore, director of the division of communicable diseases of the Massachusetts Department of Health since 1935, has been appointed deputy state health officer of Maryland. Dr. Nelson formerly served in the division of communicable diseases of the Massachusetts Department of Health. He is an associate in venereal diseases at the Johns Hopkins University School of Hygiene and Public Health and consultant to the U. S. Public Health Service.

**Forty Years as Epidemiologist**—On June 1, colleagues of Dr. Caleb W. G. Rohrer, Baltimore, chief of the Pastoral Division of the state department of health, presented to him a silver vase to observe his completion of forty years' service with the department. Dr. Charles H. Halliday, Baltimore, a former student of Dr. Rohrer's and assistant director of the department, gave the presentation address. Dr. Rohrer graduated at the College of Physicians and Surgeons of Baltimore in 1900. He served on the faculty there from 1907 to 1917. In 1902 he became a member of the staff of the state department of health.

## Foreign Letters

### LONDON

(From Our Regular Correspondent)

July 4, 1942

#### The Threat of the Falling Birth Rate

The minister of labor states that 22 million out of our total population of 35 million between the ages of 14 and 64 years are engaged in the war effort—in the armed forces, in civilian defense or in war industries. He claims that no other country has ever mobilized its manpower to this extent. Yet in the face of this greatest crisis in our history, and indeed in the history of the world, the country remains perfectly calm, and peacetime activities, except those which would in any way interfere with the war effort, continue. It is now shown by the publication (in limited form because of war conditions) of a memorandum by the Ministry of Health on "The Current Trend of Population in Great Britain." As stated in previous letters, the fall of the birth rate has reached a stage which, if the present rate continues, renders a decline of population inevitable in the near future. In the past century the population of Great Britain continuously increased. In the decade 1871-1881 the annual rate of increase was 1.30 per cent, since which time it has almost continuously fallen. The rate prior to the last war was of the order of 1 per cent, but during that war it abruptly fell to less than half that figure, at which it has remained since. This decline is reflected in the number of births. These rose from 600,000 per annum one hundred years ago to 1,000,000 between 1876 and 1914, with a peak of 1,082,000 in 1903. Then they declined to 700,000, at which level they remain today. As a result the population at the middle years of life is weighted compared with the youngest and oldest sections, for it has sprung from the period of highest births.

During the same period a great change has also occurred in the death rate, which has to some extent counteracted the effect on population of the fall in the birth rate. In the past seventy years the rate has been halved. The improvement has been greatest in the age groups 5 to 10, in which deaths are occurring at only a fourth of the frequency of the middle of the last century. This fall in the death rate has postponed a decline of population but cannot prevent it. There is an increased and an increasing proportion of the older persons in our population, but children are not being born in sufficient number for replacement. The annual birth rate in the quinquennium 1871-1875 was 35.4 per thousand. Since then it has almost continuously fallen until now it is below 16. This is only three fourths of the rate necessary for maintenance of the population.

The falling birth rate is a problem in many civilized countries. During the years before the war the women of France and of Scandinavia, as well as of Britain, were not producing enough female children to replace them when the new generation would in its turn be ready for motherhood. Though a decline of our population is certain under the present birth rate, the great social changes which seem likely to follow the war may counteract the trend. In the early part of the war there was a remarkable increase in the number of marriages, which seems to have been due to the incentive of allowances for the wives of men joining the armed forces. The result was that, notwithstanding the disruption of family life, the birth rate did not fall by more than 10 per cent. The Ministry of Health points out that our population could be maintained if the fertility of the female population was raised 19 per cent above the 1938 level. It is possible that the government may try to bring this about by family allowances.

#### Social Expenditure and the War

About half of the total national income is now being devoted to the war. Yet demands continue to be made for increase of the great expenditure on social relief. There are over four million old age and contributory pensioners, some eight hundred and sixty thousand widows in receipt of pension, and two hundred and fifty thousand allowances are paid in respect of dependent children of widows and orphans. A labor motion has been carried in the House of Commons asking the government to examine the difficulties of widows and old age pensioners created by the war with a view to action. A motion has also been tabled, with the support of all parties, urging the government to formulate a state paid scheme of allowances for dependent children as a means of safeguarding the health and well-being of the rising generation. To this an amendment has been put down, recognizing that under the stress of competition not all parents can fulfil their responsibility to maintain and educate their children, but asking the government to consider to what extent the health and well-being of such children can be safeguarded without impairing the privacy and continuity of family life and the responsibility of parentage. As pointed out in previous letters, the government is confronted by the fundamental dilemma that the increased cost of living due to the war produces demands for increased wages and increased grants, while yielding to these demands further increases the cost of living.

#### Nurseries for Working Mothers

Our women are playing a great part in the war effort. The younger ones who are not engaged in munition work are conscripted for the auxiliary war services. But the prior claim of young children on mothers is of course recognized. Nevertheless, many mothers are performing war work. To facilitate this the government is opening rapidly wartime nurseries for women doing war work. During May they were opened at the rate of nearly three a day. There are now 540 nurseries open, 576 will open soon and 216 are in preparation, a total of 1,332. The London region has just opened its hundredth day nursery and has 157 more in preparation. Premises which are being used for the purpose include first aid posts, vicarages, church and mission halls, hospitals, clinics and prefabricated huts.

#### Red Cross Makes Arrangements for First Leave of American Soldiers

Every American unit of five thousand men has its American Red Cross field director, who lives in the camp or barracks and acts as a link with their families. In London the Red Cross is making arrangements for the American soldiers whose first leave is due since their arrival in northern Ireland. Mr. Bernard S. Carter and Mr. William E. Stevenson, American Red Cross delegates to Great Britain, are in charge of the work, which includes the setting up of clubs and sleeping quarters for the men on leave and coordinating many offers of private hospitality. Thus an American might wish to visit Wales and get in some fishing there. This will be arranged with the right hosts. It is recognized as important that the people who are brought together should be likely to be congenial company.

#### Mobile Resuscitation Unit for Air Raid Casualties

A mobile resuscitation unit for the treatment of casualties due to air raids, the first of the kind, has been presented at Bradford to the regional commissioner for civil defense. It will be used under the Ministry of Health regional blood transfusion service. The unit has been given by the Bradford Red Cross and Services Comfort Fund. It has the great advantage that a miniature resuscitation ward can be set up wherever needed—in a first aid post or village hall or even by the roadside.

## Deaths

Richmond McKinney, Memphis, Tenn., Memphis Hospital Medical College, 1894, formerly professor of otology, laryngology and rhinology at the University of Tennessee College of Medicine, member of the American Academy of Ophthalmology and Otolaryngology, the American Laryngological Association, the American Laryngological, Rhinological and Otolological Society and the American Broncho-Esophagological Association, past president and secretary of the American Bronchoscopic Society, fellow of the American College of Surgeons, specialist certified by the American Board of Otolaryngology, aged 68, formerly on the staffs of the John Gaston and Baptist Memorial hospitals, at the latter of which he died June 30, of cerebral thrombosis.

Harry Albert Schneider, Coldwater, Mich., University of Vermont College of Medicine, Burlington, 1909, member of the Michigan State Medical Society and the American Psychiatric Association, specialist certified by the American Board of Psychiatry and Neurology, Inc., served in France with the Black Hawk Division during World War I, for several years was an executive officer of the Boston Psychopathic Hospital, formerly assistant superintendent and chief of the medical staff of the Michigan Home and Training School, Lapeer, medical superintendent of the Coldwater State Home and Training School, aged 56, died, May 25, in Boston of diabetes mellitus.

Marvin Fletcher Haygood, Des Moines Iowa, Atlanta (Ga.) Medical College, 1915, director of local health services and deputy health commissioner of the Iowa State Department of Health, formerly medical director of the Georgia emergency relief administration in Atlanta, director of county health work for the Georgia State Board of Health from 1918 to 1922, for six years city health officer of Knoxville Tenn., at one time superintendent of the Georgia Tuberculosis Sanatorium Alto, aged 57, died, June 28, in the Iowa Methodist Hospital of coronary thrombosis.

David Lawrence Williams, Winthrop, Mass., Tufts College Medical School, Boston, 1906, member of the New England Society of Psychiatry, assistant director, division of biological laboratories Massachusetts Department of Public Health from 1918 to 1921, member of the U. S. Public Health Service from 1921 to 1936, serving as bacteriologist and pathologist on the staffs of Veterans Administration facilities in Oteen, N. C., Rutland, Mass., West Roxbury, Mass., and Bedford, Mass., state commissioner of mental diseases from 1936 to 1938, aged 65, died suddenly, June 7, of myocarditis and bundle branch block.

Oliver Howard Jackson, Fall River, Mass., Long Island College Hospital, Brooklyn, 1894, specialist certified by the American Board of Otolaryngology, member of the American Laryngological, Rhinological and Otolological Society, the New England Ophthalmological Society and the New England Otolological and Laryngological Society, fellow of the American College of Surgeons, ophthalmologist, Union and St. Anne's hospitals, consulting ophthalmologist, Fall River General Hospital, aged 70, died June 1, of coronary occlusion, arteriosclerosis and hypertensive heart disease.

David Albert Doty, Denver, University of Nebraska College of Medicine, Omaha 1925, member of the Colorado State Medical Society, fellow of the American College of Surgeons, on the staffs of the Denver General, Presbyterian, St. Luke's, St. Joseph's hospitals and the Mercy Hospital, where he died, June 2, of massive collapse of the right lung and pneumonia following an operation for acute appendicitis, aged 41.

Charles V. Stephenson, Centerville Tenn., Vanderbilt University School of Medicine, Nashville 1894, University of Nashville Medical Department, 1902, member of the Tennessee State Medical Association, president of the Hickman County Medical Society, county health officer, aged 77, died, May 2, in the Vanderbilt Hospital, Nashville, of arteriosclerosis.

Charles Willis Larned, Baltimore, University of Maryland School of Medicine, Baltimore 1893, at one time professor of clinical medicine at the Woman's Medical College of Baltimore, formerly on the staffs of the Good Samaritan Hospital and the Johns Hopkins Hospital, aged 72, died, June 4, of hypertensive cardiovascular disease.

Benjamin Brunner Sr., Wamego, Kan., Kansas City (Mo.) Medical College, 1903, past president of the Golden Belt Medical Society and the Pottawatomie County Medical

Society, member of the state senate from 1916 to 1920, aged 63, died May 22, of sarcoma of the head or the right humerus.

Romaine C. Hoffman, Warberth, Pa., Hahnemann Medical College and Hospital of Philadelphia 1907, instructor of medicine at his alma mater, on the staff of the Hahnemann Hospital, Philadelphia, a member of the draft board during World War I, formerly county coroner, aged 59, died, May 11.

Daniel Leon Elkins, Long Beach, Calif., University of Kentucky Faculty of Medicine, Russia 1910, Columbia University College of Physicians and Surgeons, New York, 1924, served in the medical corps of the Imperial Army during World War I, aged 57, died June 8, of heart disease.

William John Moldenhauer, Chicago, College of Physicians and Surgeons of Chicago School of Medicine or the University of Illinois, 1906, on the staff of the Lutheran Deaconess Hospital, aged 60, died June 30, at his summer home in Birdwood, Wis., of myocarditis and nephritis.

Claus Peter Hoyer Kjaerbye, Fresno, Calif., Kobenhavn University Laegeviden kabet, Fakultet, Denmark, 1922, member of the American Psychiatric Association, specialist certified by the American Board of Psychiatry and Neurology, Inc., aged 74, died May 6.

George M. Hoover, Lancaster, Pa., Hahnemann Medical College and Hospital of Philadelphia 1889, formerly member of the city council, served on the civil service examining board of the police department, formerly police physician, aged 76, died May 19, in St. Joseph's Hospital.

Jefferson Davis Singleton, Maryville, Tenn., Vanderbilt University School of Medicine, Nashville, 1887, member of the Tennessee State Medical Association, formerly health officer of Maryville, aged 79, died, May 31, of pulmonary tuberculosis.

De Witt Price Higgs, Chula Vista, Calif., Bennett College of Eclectic Medicine and Surgery, Chicago, 1907, veteran of the Spanish-American War and World War I, aged 65, died May 17, of coronary occlusion and chronic myocarditis.

Daniel Lee High, Beverly Hills, Calif., George Washington University School of Medicine, Washington, D. C., 1907, formerly surgeon in the U. S. Public Health Service reserve, aged 68, died May 30, of chronic myocardial degeneration.

Libertad Roberts Gaetan, San Juan, P. R., Harvard Medical School, Boston, 1932, member of the Medical Association of Puerto Rico, medical director of the Insular Tuberculosis Sanatorium, Rio Piedras, aged 34, died, May 5.

Henry Max Lissack, Concordia, Mo., Homeopathic Medical College of Missouri, St. Louis, 1903, examining surgeon for the Bureau of Pensions, Department of the Interior, at Lexington, aged 78, died, June 20, of cerebral hemorrhage.

Joseph Henry Downing, Rising City, Neb., Rush Medical College, Chicago 1882, member of the Nebraska State Medical Association, aged 86, died May 27, in the Lutheran Hospital, Columbus, of shock due to a fractured hip.

John Davidson Frame, Resht, Iran, University of Pennsylvania Department of Medicine, Philadelphia 1904, for many years a medical missionary, in charge of general medical work at the American Hospital, aged 61, died, June 11.

C. D. Barres, Lakeland, Fla., Medical College of Alabama, Mobile 1897, aged 76, died June 1, in the Florida State Hospital, Chattahoochee, of carbuncle of the back and hypertensive cardiovascular disease.

Raymond W. Moore, Eureka, Kan., University Medical College of Kansas City, Mo. 1899, county health officer, aged 69, died, May 16, of uremia and cardiac insufficiency.

William Miller Thorne, Charleston, S. C., University of Michigan Department of Medicine and Surgery, Ann Arbor 1910, aged 61, died May 13, of coronary occlusion.

H. Clay Foster, Beaufort, S. C., University of Georgia Medical Department, Augusta 1900, aged 67, died May 22, of coronary thrombosis.

## DIED IN MILITARY SERVICE

Donald Stanley Gidley, Ontario, Calif., University of Oregon Medical School, Portland 1930, member of the California Medical Association, was called to active duty March 3, 1941, as a captain in the National Guard, Medical Detachment, 185th Infantry, aged 33, died July 1, at Fort Lewis, Wash., where he died of coronary occlusion.

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

#### American Journal of Diseases of Children, Chicago

63 839-1018 (May) 1942

Pectin and Galacturonic Acid and Intestinal Pathogens. S. C. Welch, R. W. Jung, H. Plenk, A. A. Day and A. C. Ivy, Chicago—p. 839.  
Monozygosity in Mongoloid Twins. Norma Ford, Toronto, Canada, and Sylvia Franklin, Greystone Park, N. J.—p. 847.

Erythroblastic Anemia Following Splenectomy in Cases of Chronic Familial Hemolytic Anemia. E. Strumsky and A. C. Regan, Manila, Philippine Islands—p. 859.

Study of Pertussis Antibodies. Protective, Agglutinating and Complement Fixing Antibodies in Patients with Pertussis. Persons Exposed to Pertussis and Persons with No Known Exposure. Lucy Mishulow, M. Siegel, William Leifer and Sadie R. Berkey, New York—p. 875.

Method of Assaying Trypsin Suitable for Routine Use in Diagnosis of Congenital Pancreatic Deficiency. Dorothy H. Andersen and Mari Luise V. Early, New York—p. 891.

Is the Presence of Bile and Food in Small Intestine Necessary for Formation of Prothrombin? Studies on Three Infants, One with Congenital Absence of the Gallbladder and Extrahepatic Ducts and Two with Congenital Atresia of the Esophagus. H. N. Sanford and Irene Shmigel'sky, Chicago—p. 894.

Respiratory Metabolism in Infancy and in Childhood. XIV. Specific Dynamic Action of Amino Acids in Infants. M. Dunn, M. D. Kelly, H. McNamara and J. C. Curtis, New York—p. 900.

Congenital Absence of the Four Extremities. Case Report. W. P. Killingsworth, Port Arthur, Texas, and R. Engleadow, Anaheim, Texas—p. 914.

\*Typhoid at the Age of Fourteen Months. Case Report. H. G. Bull, Ithaca, N. Y.—p. 919.

Enterogenous Pulmonary Cyst. Case Report. I. M. Ward and J. B. Krihl, Flint, Mich.—p. 924.

Design Characteristics of Double Cubicle System for Protecting Babies in Nurseries. J. A. Reymers, Notre Dame, Ind.—p. 934.

Retinoblastoma of Infants and Children. Its Significance as Pediatric Problem. S. J. Nickham, Detroit—p. 945.

**Typhoid at Age of Fourteen Months.**—According to Bull, symptoms of typhoid in children have always varied considerably from the clinical picture in adults. So variable is the picture that undoubtedly many cases are not discovered. Children with blood yielding typhoid bacilli on culture have been born during the course of typhoid in the mother, and there is evidence of transmission of the disease through the placenta and through breast milk. The author's patient, a girl aged 14 months, had not been out of town or eaten away from home, and no one among her associates had been ill. The mother had had typhoid thirty years previously. The father's stools did not contain typhoid bacilli, culture of the mother's stools yielded a luxuriant growth.

\*Neurocirculatory Asthenia and Related Problems in Military Medicine. B. S. Oppenheimer, New York—p. 367.

Present Status of the Diagnosis of Uncomplicated Syphilitic Aortitis. E. P. Maynard Jr., Brooklyn—p. 383.

Coagency in Approach to Problem of Rheumatic Heart Disease. E. S. Rogers, Albany, N. Y.—p. 392.

Studies on Headache. Mechanisms and Significance of Headache Associated with Brain Tumor. E. C. Kunkle, B. S. Ray and H. G. Wolff, New York—p. 400.

**Neurocirculatory Asthenia.**—Oppenheimer points out that neurocirculatory asthenia becomes more intensified, better defined and more common under military conditions than in civil life. An abnormal reactivity of the nervous system, including the innervation of the circulatory system, probably accounts for the varying neuropsychosomatic symptoms of the disorder. The symptoms are physiologic and psychologic. A history of constitutional physical asthenia is obtained in about 70 per cent of recruits or soldiers with psychoneurotic factors. Some of these soldiers, forced out of bed and obliged to take graduated

exercises for a period of weeks, return to high grades of physical exercise and to military duty. In exceptional instances the diagnosis is doubtful for weeks and is helped by the therapeutic test of physical training. Paroxysmal tachycardia, premature beats and sinus arrhythmia occur in the course of neurocirculatory asthenia. Pure fear can temporarily produce changes in the electrocardiogram which somewhat resemble those of coronary insufficiency. In the differential diagnosis pulmonary tuberculosis, toxic diffuse goiter, early organic valvular disease, rheumatic carditis and hypertension must be considered. The question of prognosis is divided into (1) immediate, based on response to graduated physical exercise, and (2) ultimate, after return to civil life. The ultimate prognosis of 601 soldiers followed by Grant for five years shows that 153 per cent were fit, 178 improved, 562 stationary, 32 worse, 87 had some serious disease and 23 per cent died. This general prognosis is modified by the age of the patient and tolerance to exercise. The younger the patient and the better his tolerance to exercise the greater are his chances of ultimate recovery. The latest statistics among 115,569 registrants in the New York City area were that 12,261, or 10.61 per cent, were rejected because of disease of the heart, blood vessels and circulation, 195 were rejected for neurocirculatory asthenia and many (1,180) instances of neurocirculatory asthenia were rejected under the caption of tachycardia or of one of the psychoneuroses. Registrants with neurocirculatory asthenia, unless it is mild, are disqualified by the draft board and classed IV-F, but if mild, they are classed I-A and accepted for full duty. Treatment is preventive and curative. The latter consists in attempts at physical and psychologic rehabilitation, best accomplished by the collaboration of the cardiologist and the neuropsychiatrist. Preventive treatment must allow a proper convalescent period after any infection or severe operation. After complete recovery, patients should be gradually hardened before returning to full duty. Neurocirculatory asthenia should be recognized early, especially in children, and measures taken to prevent the condition from becoming chronic.

**Sulfadiazine Treatment of Burns.**—Since October 1941 Adams and Crawford have applied sulfadiazine as the initial therapeutic agent to all fresh burns. From their experience in 50 cases they feel that the preparation consisting of 3 per cent sulfadiazine in 8 per cent triethanolamine presents definite advantages over all other closed methods of treatment of burns. (1) It makes the patient more comfortable, (2) it tends to inhibit infection, especially during the early period of treatment, and in this respect is unquestionably more efficacious than either tannic acid or aniline dyes, (3) it does not stain the linen or bed clothing, as do the aniline dyes, (4) the eschar is slightly flexible, thus affording the patient more freedom of movement than is possible with the thick tannic acid eschar, and (5) when infection develops, the eschar is easily removed with dressings saturated with saline solution or oil. The authors plan to continue the treatment using a modified formula of a 15 per cent sulfadiazine in 3 per cent triethanolamine with the addition of aerosol, methocel and sodium benzoate.

Fatal Tapeworm Enteritis A Hurst and A H T Robb Smith—p 58  
Traumatic Duodenal Ulcer Repeated Hematemesis from Postoperative Hemorrhagic Gastritis A Hurst W H Ogilvie and C K Simpson—p 61

**Pathogenesis of Sprue Syndrome**—Hurst states that tropical sprue, nontropical sprue and celiac disease are varieties of the same disorder—the sprue syndrome. The part of the world in which the disorder originates and the age of the patient are the only differentiating factors of the syndrome. The sprue syndrome has three characteristics and constant features: (1) The stools contain an excess of split fat but no excess of neutral fat, meat fibers or starch and no inflammatory material; (2) roentgenography reveals the disappearance of the normal feathery or herring bone aspect of the duodenum and jejunum produced by the valvulae conniventes; and (3) no pathologic changes are present in the intestine after death if post-mortem changes have been prevented. With adequate treatment the normal absorption of fat and the normal roentgenographic appearance of the small intestine are restored. It is suggested that the characteristic features of the sprue syndrome result from paralysis of the muscularis mucosae, which leads to loss of the pumping action of the villi and to flattening of the valvulae conniventes without changes in the mucous membrane. Paralysis of the muscularis mucosae may be secondary to loss of the normal stimulant of Meissner's (submucosal) plexus or to the effect of vitamin deficiency or some toxemia on the plexus. An exception must be made for cases associated with disease of the mesenteric lymph nodes in which fat absorption is hindered at the level of the mesenteric glands instead of in the villi.

**Excision of Patella**—From June 1937 to December 1940 34 patients with a simple fracture of the patella were admitted to Guy's Hospital. The fracture was transverse with separation in 17, transverse without separation in 4, stellate with separation in 5, stellate without separation in 4 and with a single longitudinal break in 4. Most of the patients were treated on orthodox lines, but 8 with simple transverse fractures with separation, Wass and Davies state, were submitted to excision of the patella. Seven of the 8 were examined and followed up; the eighth patient replied to a questionnaire. Ossification in the quadriceps tendon was noticed frequently. The results in the 7 cases are far from impressive after a follow up period of from more than three years to five months. Only 2 patients were able to return to work within ten weeks; the remainder having 'off work' periods much in excess of this and 2 have not returned to their work at all. In no single case was recovery of function in the knee joint even after relatively long follow up periods complete. Only 4 other

patients with transverse fractures and 2 with comminuted fractures treated during the same period could be examined; their average 'off work' period was five months less than in the excision group. The 5 men in the group were able to return to their original strenuous occupation. Still more important, 3 of the patients with transverse fracture showed complete recovery of function of the knee as evidenced by a full range of movement, a stable joint, no osteoarthritis and complete absence of symptoms when examined at periods up to three years after the operation. The symptoms of the patients in whom the patella has been excised are significant. Pain occurred in 4, stiffness was complained of by 5, and the stiffness was associated with a decided limp in 3, with inability to kneel in 5 and with inability to run in 6 of the 7. All had difficulty on stairs, having to walk stiff legged. A feeling of insecurity was a prominent symptom in 5, 3 of them have had falls when walking on level ground. Flexion of the knee joint was limited in all the power of the quadriceps, in spite of the absence of wasting was 2 to 4 pounds below that of the opposite leg in 5 of the 6 in whom it was measured, and some ossification in the quadriceps tendon occurred in the 6 patients whose knees were examined roentgenologically. The authors conclude that their cases are too few to allow any dogmatic conclusions, but the uniformity of the bad results strongly suggests that the operation does not possess the advantages claimed for it. Brooke's claims of a decreased period of disability and increased power in the knee joint are not substantiated nor are the disadvantages of pain and limited flexion ascribed to other operative procedures eliminated by total excision of the patella. The pathologic ossification after the operation is a definite disadvantage.

**Constancy of Blood Groups**—A homotransplant from one sister to another gave Lauer the opportunity to observe a reversible change in the blood group of one of the sisters. A young girl had lost the right leg in a railroad accident. To save the injured left foot a skin graft was made from her sister. The two sisters, who were of the blood groups OM and A<sub>1</sub> MN respectively were connected with each other by a transplant which involved a communication between the two circulations. Whereas the recipient of the skin graft tolerated the foreign OM blood as such, the donor developed an extremely strong immune body against the A antigen of the recipient. Thus the donor gradually destroyed the A blood which flowed into her from the recipient, and she developed the clinical symptoms of a hemolytic icterus. The blood cells of the recipient decreased to such an extent that the group characteristics A<sub>1</sub> and N were no longer demonstrable. From this and from serologic experiments it was concluded that three-fourths of the blood circulating in the recipient consisted of the OM blood of the donor. However this OM blood could not replace the lost A cells because it always returned to the circulation of the donor. In spite of an overactive erythropoiesis in the recipient, her condition seemed so grave after eight days of being joined to her sister that the union had to be ended. The subsequent serologic transformation in the recipient from OM by way of A M toward A<sub>1</sub> MN was completed in two weeks. This restoration of the original blood structure provides an experimental proof of the constancy of blood groups. The described homotransplant indicates that artificial synchysis is possible in human subjects but that it should be attempted only in persons of the same blood group. The difference in the MN factors apparently is of no importance, but the possibility of the development of anti  $\lambda$  or anti B antibodies is discussed.

## Book Notices

**Intelligence Power and Personality** By George Crile. Edited by Grace Crile. Cloth. Price, \$3. Pp. 117, with 12 illustrations. New York & London: Whittlesby House, McGraw Hill Book Company, Inc., 1941.

This is an interesting volume but it does not completely live up to its title. Dr. Crile became much interested in the relationship of the size of the brain and the various organs to the activities of animals. For that reason he, his family and his staff made field trips to the tropics, to the subarctic regions and to Guatemala as well as to various parts of the United States to get specimens of animals for this study.

The book is divided into five parts and a short introduction. The first part deals with the discussion of animal behavior and energy. The second part takes up in detail the behavior of various animals in relation to their body weight, heart weight, adrenal weight and thyroid weight. The third part applies to civilized man, comprising studies in the effect of training and education and including in analysis of weather changes in relationship to various disorders, which Dr. Crile correlates with some of his findings. The fourth part is a summary and discussion which points out that the findings fall in with Dr. Crile's bipolar theory of life—that there is a constant relationship of the size of the brain to the energy output, that animals which move quickly have an excessive adrenal weight, that temperature, humidity and storm influence the energy controlling organs. One might emphasize the statement "Intelligence, power and personality are dependent on the absolute and relative size of the brain, the thyroid gland, the heart and blood volume, the celiac ganglia and plexuses, and the adrenal-sympathetic system." The last part of the book is an appendix, comprising twenty-six pages of tables giving data about the various specimens which were studied. The book is highly technical and well illustrated with diagrams. There are several graphs and a number of small and large tables. It must be considered as a contribution to zoological and physiologic theory, and one must admire Dr. Crile for his energy in collecting the material, compiling it and reaching his very interesting conclusions.

**Survey of Compounds Which Have Been Tested for Carcinogenic Activity** By Jonathan L. Hartwell. Research Fellow, National Cancer Institute, National Institute of Health, United States Public Health Service, Federal Security Agency, United States Public Health Service. Paper. Pp. 371. Bethesda, Maryland, 1941.

This is a pamphlet bound in paper and printed by the offset process, presumably for distribution by the United States Public Health Service. The title describes the contents. It is a bibliography of practically all the important compounds which have been tested as carcinogenic agents. It does not include an enormous number of products which have been used in treating animal tumors in a purely routine fashion in order to see whether any one of these substances, most of them belonging in the group of dyes, have any therapeutic property. While most of the substances studied for their carcinogenic quality have a phenanthrene nucleus, reference is made also to various organic acids and substances such as formaldehyde, for example, and a considerable number of inorganic compounds, of which, of course, radium, thorium dioxide and other radioactive substances are known to be carcinogenic. Also the strange results which have been obtained in producing testicular teratomas by the application of zinc salts are referred to. Most of the animals used in all this work were mice, of which the number of animals is given under each reference, and also the duration of the experiment, which is an important fact. Rabbits have proved very sensitive to mesothorium, and tumors have been produced in guinea pigs by the prolonged action of small quantities of radium, while roosters seem to be especially susceptible to zinc chloride.

The volume is completed by a large bibliography and a satisfactory index, which includes not only the substances referred to as possibly carcinogenic but also the route and site of application of the substances, a species index, a tumor site index and a vehicle index. The book represents an enormous amount of labor, and every one who is doing cancer research should

be grateful to the National Institute of Health for furnishing such an invaluable and labor saving survey. There is properly no reference to that malodorous paper which appeared in the *Zeitschrift für Krebsforschung* a few years ago concerning the alleged production of sarcomas in rats by the injection of tomato juice. It is now generally agreed that the tumor found in the animals was the Jensen rat sarcoma introduced by a technician ambitious to please his employer.

One generalization can be made from the contents of this work, that there is presumably no specific carcinogenic substance, because tumors have been produced in susceptible animals with the most extraordinary variety of chemical substances. It is obvious that any agent which causes continuous proliferation of cells without causing too much tissue destruction may prove to be a carcinogenic agent.

**Motivation and Visual Factors. Individual Studies of College Students** By Irving F. Bender et al. Cloth. Price \$1. Pp. 369. Hanover, N. H.: Dartmouth College Publications, 1942.

This publication represents a careful and exhaustive report on investigations of the visual and psychologic factors observed and studied by Bender, Imus, Rothney, Kemple and England on members of the 1940 class at Dartmouth College. The report covers a study of the academic accomplishments, health and scholastic aptitude as well as visual measurement data, psychologic tests and interviews over the four year period of attendance. The class comprised over five hundred members, and intensive studies were made of one hundred and twenty-four of the total. Twenty of these, including psycho-portraits of each, were chosen for presentation in this work. Extreme deviations in visual factors do not cause maladjustments but, instead, furnish possibilities for alibis, rationalization for feelings of inferiority or conversely incentive for compensations. How the visual factor was utilized depended entirely on the personality structure of the individual. In this connection the work appears to go a long way toward disproving the adlerian theory of organ inferiority as being of paramount importance in the determination of personality development. This book should be of interest to parents who have children with visual defects as well as for ophthalmologists, students of psychology and educators as a whole. It is to be hoped that other studies of a similar character will be made and reports published in allied fields. Personality structure is fairly well established long before admission to college, and therefore constructive application of the findings contained in this report should begin during the formative years of childhood. For this reason, if for no other, this work should be particularly studied and evaluated by those educators who play such a leading role in influencing the early development of human personality.

**A Study of the Blood in Cancer with Special Reference to the Needs of the Tumour Clinic** By O. Cameron Gruner, M.D. Cloth. Price, \$4. Pp. 100 with 40 illustrations. Montreal: Renouf Publishing Company, 1942.

This book discusses the results of studies of the blood, fresh and in stained films, with special reference to cancer. The microscopic method is described in detail. Any claim that there is a blood test or state which is specific for cancer is not advanced, but attention is focused on a pattern of feature which may have diagnostic significance in certain cases of cancer. The practical value of the method, if it has any, remains to be determined. The evidence presented in the book is not conclusive or impressive.

**Human Skeleton Showing Principal Arterial Circulation (First Aid Pressure Point Chart)** Cloth backed paper with wood rollers top and bottom. Price \$2.25. Size 16 x 54". New York: Clay Adams Company, Inc., 1942.

The publishers have prepared on heavy stock, reinforced with linen, an anatomic chart showing the skeleton of the human body in outline as well as the external surfaces and then in brilliant red have indicated the large arteries of the body, the points of pressure for application of pressure to prevent hemorrhage, the bones and other indications as to the points of application for tourniquets. A schematic design of this type is invaluable to all classes in first aid and also for the training of nurses and nurses' aides.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT HOWEVER REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST.

### EFFECT OF FLUOROSCOPY ON EYES

To the Editor—1 Does fluoroscopic work of about one hour a day (chest work) have a harmful effect on the eyes? If so what protection should be used? 2 Is this the consensus of radiologic opinion? H. L. Garland in an article entitled Fluoroscopy in the Diagnosis of Pulmonary Tuberculosis (*Am Rev Tuberc* 45 2 [Jan] 1942) says: It is the scattered radiation which most of us should beware of, and this can best be diminished by using small beams and working fast. Conventional lead aprons and gloves are of little use in chest work. Would it then be as well to discard the cumbersome gloves and lead apron?

M. D., California

ANSWER—1 It is generally understood that the delicate and highly specialized tissues of the eye are not more sensitive to x-rays than the external facial structures. But few cases of retinitis have developed in x-ray workers. All fluoroscopic work, however, involves eyestrain in the common sense.

2 On account of the small amount of scattered radiation present in the chest fluoroscopy, protective gloves and aprons have not been generally discarded. A dental film carried in the vest pocket for a week tells whether a particular worker is unduly exposed.

### ORCHIECTOMY IN CARCINOMA OF THE PROSTATE

To the Editor—In *Queries and Minor Notes* in *The Journal* March 17 a reference to castration as treatment of carcinoma of the prostate was made. Would you advise that a man aged 84 with a carcinoma of the prostate with acute retention treated by transurethral resection and high voltage roentgen rays with complete relief of the symptoms now have a castration done to retard the return of symptoms? The diagnosis of carcinoma was confirmed by microscopic examination of tissue removed by resection.

M. D., North Carolina

ANSWER—The indications for orchiectomy in a case of carcinoma of the prostate have not yet been defined. According to some urologists orchiectomy should be performed in every case of prostatic carcinoma. Others believe that one or more of the following factors should be present before orchiectomy is carried out: evidence of local or distant extension of the neoplasm; pain; urinary obstructive symptoms; cachexia and edema of the lower extremities. Theoretically, orchiectomy should retard the return of symptoms but this has not yet been proved. Because of its slow growing characteristics in very aged men, carcinoma of the prostate is usually well tolerated by such patients. It would not seem advisable to perform orchiectomy on a patient aged 84 years who had received complete relief from symptoms by transurethral resection and roentgen therapy.

### TREATMENT OF TABES DORSALIS

To the Editor—A woman with tabes dorsalis was completely paralyzed one year ago from the waist down but at present she has developed control of her bowels and kidneys and can walk fairly well. Do you think diathermy short wave or a general fever therapy treatment would be indicated? If so is there some public institution in this district where she may obtain such treatments? She is virtually without funds. What other treatment would you advise? She has had all the usual types of treatment such as neosarsphenamine, bismuth compound and mapharsen.

W. B. Chapman, M.D., Joplin, Mo.

ANSWER—This question poses a very difficult problem, from both economic and medical points of view.

The first consideration is the accuracy of the diagnosis of tabes dorsalis. Complete paralysis of the legs does not occur in this disease unless other complicating features are present. Does the inquirer mean not that the legs were completely paralyzed but that they were so ataxic as to be unusable?

What if any, treatment should be given from this point on would depend on detailed information which is not supplied. It would be desirable to have the patient examined by a neurologist and to have available the results of recent blood and spinal fluid examinations. It is also desirable to know what if any complicating diseases are present.

If the patient has tabes which is still progressive in spite of treatment and if there are no contraindications in her general physical condition, fever therapy preferably with induced malaria is probably desirable. Since the patient is virtually

without funds and therefore presumably unable to pay the cost of hospitalization information as to the institution in which fever therapy can be administered may be obtained from the venereal disease control officer of the Missouri State Health Department, Jefferson City.

If the patient's disability is actually due to severe ataxia rather than to muscular weakness residual on paralysis of some nature it is however, probable that neither fever therapy nor any other form of antisyphilitic treatment will materially improve the situation and the best to be expected is arrest of the process at its present level. Under these circumstances a great deal can be accomplished by several years of painstaking physical therapy and reeducation by the Frenkel system at the hands of a physical therapist skilled in this method. Unfortunately this is also difficult to arrange for patients without funds.

### TREATMENT OF VITILIGO

To the Editor—Kindly send information on the therapy of vitiligo with special reference to a stain to cover the blemish and the latest in vitamin or other therapy.

M. D., Wisconsin

ANSWER—In the treatment of vitiligo, small areas may be colored with a solution consisting of sufficient bismark brown sufficient henna carmine 5 per cent, fluid extract of walnut (*Juglans nigra*) 20 per cent aromatic spirit of ammonia 25 per cent and sufficient alcohol to make 100 per cent which is applied coat on coat until the desired color is obtained. In some cases stimulation of pigment formation may take place after painting the lesions with 10 per cent oil of bergamot in alcohol and then exposing the area to the quartz light. Vitamin C in large doses and injections of gold sodium thiosulfate in addition to many other measures have been recommended. Systemic treatment consists in the correction of any endocrine or metabolic disorders and the administration of iron or arsenic tonics. Yang (*Acta dermat venereol* 21 657 [Nov] 1940) treated a group of cases with a gold preparation (Iopion) given intradermally.

### ISOPROPYL ALCOHOL FOR STERILIZATION OF METAL INSTRUMENTS

To the Editor—In view of the shortage of ethyl alcohol I should like to know if isopropyl alcohol is just as effective for purposes of sterilization of metal instruments. What percentage by weight or by volume would be required? The medicated ethyl alcohols on the market are either highly perfumed or contain ingredients which are sometimes irritating or have an unpleasant odor.

E. William Abramowitz, M.D., New York

ANSWER—Isopropyl alcohol is a somewhat stronger germicide against vegetative forms than is ethyl alcohol. In addition it has advantages of lower surface tension and greater fat solvent action. The maximum bactericidal concentration of isopropyl alcohol is full strength as compared with a maximum bactericidal concentration of 70 per cent by weight for ethyl alcohol. The best grades of commercial isopropyl alcohol are said to be 98 to 99 per cent. The small water content of these solutions renders them less corrosive for metal instruments than the 70 per cent ethyl alcohol solution.

Unfortunately however neither ethyl nor isopropyl alcohol can be depended on to kill spores. Brewer (*THE JOURNAL* May 20 1939 p 2009) has shown that scalpels are frequently contaminated with sporulating pathogenic micro-organisms. That is probably true also of needles, scissors and other instruments which come into contact with skin. Immersion in isopropyl alcohol for several hours or even several days is not a trustworthy method of sterilizing such instruments.

Isopropyl alcohol is sold at present in unadulterated form which is not irritating to the operator's hands or patient's skin.

### SENSITIVITY TO THYROID PRODUCTS

To the Editor—A woman aged 52 has been suffering for a number of years from severe attacks of bronchial asthma. She also has a basal metabolic rate of minus 30 and presents symptoms of hypothyroidism such as excessive gain in weight and tiredness. Whenever she takes thyroid she gets a spell of asthma which lasts four to five days. Cutaneous tests showed her to be sensitive to fish products. I have tried all kinds of thyroid preparations without any success. Please advise me what to do to desensitize her against thyroid medication which she needs very badly.

M. D., Colorado

ANSWER—The inquiry does not state whether the patient is sensitive to the animal source from which thyroid is obtained. In order to catalogue this patient properly the following procedures are advised. Tests should be made with a definite portion of beef and pork, and also with thyroid extracts of the same animal. If reactions are obtained with the thyroid and not with the beef or

## CIVILIAN HEALTH IN WAR TIME

CHAIRMAN'S ADDRESS

HAVEN EMERSON, M.D.

NEW YORK

It is appropriate that while dedicating medicine to the maintenance and betterment of the health of our nation in this time of war, we celebrate the first century of public health, which had its origin and took definite purpose and form with the publication of that classic "A Sanitary Survey of the Labouring Population of Great Britain" by Edwin Chadwick and his medical collaborators, Drs Southwood Smith, James Phillips Kay and Neil Arnott.

At the very outset of this hundred years of progress in public health philosophers in this country reminded the people that health is the first wealth, and the pomp of emperors becomes ridiculous by comparison.

Increasingly intelligent and liberal application of the sciences and practical arts of preventive medicine through local, state and federal government has been interrupted only by periods of war, and even during these interludes of destruction the compelling need for manpower and the lessons learned in mass management of men under arms and in supporting trades and industries have stimulated the people and their agents in public service to increased efforts, with the result that each war has been accompanied and followed by greater concern and improvement in the nation's health.

We can say with honesty and accuracy today, as our predecessors have been able to declare annually since the last war, that all the indexes of improving health are favorable. I would not have you understand from this that there is no ignorance, poverty, neglect or incompetence among us resulting in great masses of residual and wholly preventable disease. It is, however, necessary to recognize the true and relative excellence of the health of our people now as compared with any previous year or with the health of any comparable population aggregate of races elsewhere under any form of government, so far as we have human records. Furthermore, there is no present or reasonably predictable threat to the continued improvement of the health of our civilian population from the contingencies of war if we do but hold firmly to the methods we have found effective and use thriftily the professional, material and nutritional resources available to us.

Famine and pestilence, the traditional enemies of man's security and survival, do not face us with any real hazard today. Even the fears of fanatics the fantasies of faddists, cannot create a danger of food

shortage and there are only two epidemic diseases against which we have neither the warning of a calculable approach nor means for prevention and control when once they become manifest. These are influenza and poliomyelitis. Neither of these diseases is necessarily or otherwise than accidentally related, and certainly not causally to wars and their disturbances of commerce and human intercommunication.

There are perhaps only two categories of disease on which the effect of war will probably be unfavorable: those affecting chiefly persons in the later two or three decades of life and those related to the dislocation of normal social relations and due to an attitude of recklessness in the face of life's uncertainties and frustrations. With emphasis necessarily and rightly placed on health and fitness of men and women of the ages of military and industrial usefulness, there may be less than the desirable and humane care and possible prevention of such major causes of death as prevail among persons of 65 and over—cancer, diabetes, heart diseases and arteriosclerosis. The biologic urge of sex expression and the fallacious sense of self satisfaction and release attained through the use of alcoholic beverages are closely linked to the increasing prevalence of venereal infections. We may expect in the civilian as in the military population an increase in the direct and indirect effects of alcoholism and syphilis in this war-time unless there is something like a revolution in the social attitudes toward both liquor drinking and venery. Every alcoholic and syphilitic person is an obstruction to military and civil preparedness for national offense.

What then are we the physicians of the country, and our patients, such of us as remain unregimented, and out of uniform, to do and to advise so that there will be the least possible loss in national health or better still that in winning the war we shall also be building a way of life better worth fighting for—a life with added depth and breadth and richer in quality as well as longer in years of enjoyment and contributing happiness to others?

What have been the factors of enduring worth responsible for the consistent and nationwide improvement in health in the interwar quarter century since 1917?

Let me indulge in but one statistical reference to the improved mortality experience of our industrial and wage earning men and women and their families among whom the general death rate from all causes has fallen 54 per cent and the specific death rates from seven important communicable diseases together have fallen 82 per cent in the past twenty-five years as shown in the accompanying table.

Then too those most sensitive indexes of good medical care, maternity and infant death rates have reached unprecedented low points in the past five years. Not significant evidences of a constructive rising regard

for human life. And yet we see clearly that we collectively and publicly apply much less than we know individually and professionally of the facts and uses of preventive medicine.

Not quite 70 per cent of our population live under forms of local government which include public service for health by medical officers employed full time at public expense. And of the full time local county and city health officers now on duty scarcely half have had the graduate professional education and practical field experience to qualify them for their duties.

Furthermore, in about half of the counties with full time health officers there is neither the supporting accessory personnel for sanitation, nursing, laboratory and statistical technique required for the area and population nor reasonable security through civil service against removal for political reasons, regardless of the quality of the services rendered.

We know that the public application of preventive medicine under the authority of the law and using tax resources is indispensable in our social, economic and political setting. Where it has been consistently used there has been excellent achievement locally and in whole states, as in Wisconsin, Minnesota and New York and in other areas less extensive.

*Fall in Death Rate, per Hundred Thousand, of Seven Communicable Diseases*

FULL TIME HEALTH SERVICE

The first objective of the medical profession now should be to encourage and demand for the sake of their patients a total coverage of the national area and of the population by full time health service, on a county or district basis, responsible to local government and receiving expert specialist assistance and consultative advice from the respective state department of health.

To accomplish this I consider the first obligation of the county, district and state medical societies, with the central support and encouragement of the Trustees and headquarters staff of the American Medical Association. It took the American Medical Association and the American Public Health Association and many helpful voluntary and commercial agencies interested in health thirty-one years to cover the nation with model state vital statistics laws, which ultimately made possible the declaration of a national birth and death rate.

It should not take five years to set up and staff local departments of civil government under full time trained medical officers of health so that indispensable basic protective, preventive and constructive health services would be accessible to every person, family, household and place of employment in continental United States and its insular possessions.

There are not less than forty million people in continental United States now who fail to receive from local and state government what some ninety-two million of their fellow citizens are benefited by.

Among the important reasons for the sustained excellence of general health in Great Britain, even under the cruel handicaps of bombardment, food shortage and dislocation of living and working conditions these past two years and a half, has been the maintenance of total coverage health service under local or regional government control by civil service experts in public health. Regardless of troop movement or evacuation, emergencies of production or transportation, every inch of England and each least person and village has had the protection of a public health service of uniformly good quality, respected and assisted by the practitioners of medicine chiefly concerned with care of the sick. Meningococcic meningitis and tuberculosis among children have increased in some seasons in each year, apparently as the result of the long continued use of shelters against bombing and incendiary air raids. Except for these and the slightly increased occurrence of localized outbreaks of enteric infections due to food, the health of England has been as good as in the recent prewar years, and in respect to maternity, infancy and the common communicable diseases of childhood the record has been better since 1939 than it was before.

We must and can do as well or better in this country, but for this purpose we must have health services over all the nation at the earliest possible date.

NECESSITIES IN CARE OF THE SICK

Second, if at all, to the necessity of universal availability of public health services is that for the trio of indispensables in care of the sick, the family physician, the local or regional general hospital and a visiting or bedside nursing service.

Even deducting the 23,400 physicians needed for men under arms and the 22,000 who are not fit for active practice or are already diverted into other pursuits, there will remain a ratio of 1 physician for each 988 of the population—a number ample for all necessary medical purposes if distributed according to population rather than in response solely to the physicians' personal economic and social advantages and preferences.

England and Wales have approximated adequacy according to their standards with a ratio of 1 physician to 1,490 persons, and Sweden satisfies her people with a highly organized staff providing 1 physician for each 2,890 of the population.

Care of the sick in wartime as in peacetime is something other than health service and is the first claim of the public on medicine, but good care of the individual sick includes on the family basis the best opportunity to guide and protect personal health. Unless diagnosis and treatment of sickness is available to all, health protection on the personal or public basis cannot function. Back of the public health service is therefore a reasonably uniform and accessible care of the sick by the individual family physician. For the practical use of those skills of diagnosis and treatment which the sciences have put into our hands, the hospital is a shop which the physician must have for the 10 per cent or so of his patients who cannot be otherwise well cared for. To bring to the bed patient at home the kind of nursing care the hospital offers, and to reduce the number of calls on the sick required of the physician, the visiting bedside nurse is our profession's most valuable assistant.

The community which cannot command the services of a physician, access to a hospital within 30 or 40

niles, and a visiting nurse is in a worse dilemma than it was without a full time trained medical officer of health.

These necessities of health and care of the sick appear to me to present the medical profession with enough unfinished business to demand its immediate, united and sustained attention, until they are met in a manner consistent with the usefulness of medicine, and within the resources of each community, alone or assisted by those of the state and probably in some instances but certainly in a small minority by federal grants. Local responsibility and resources will generally go further and produce more tangible results per dollar spent than will those of either state or federal government. State aid can be shown to be commonly adequate to meet the health needs of its few county or district areas which cannot support their own local services.

There are some states whose economic dependence and tax limitations are such that only by obtaining federal grants can even the minima of medical services be obtained for some counties. Federal subsidies to all states regardless of proof of the financial need in each instance lead to extravagance, log rolling and a great variety of political abuse without commensurate or offsetting benefits to local government health functions.

#### WORK TO BE DONE

If we can assume that there will be within practical reach the full time health officer, the practicing physician, the hospital, the visiting nurse and I may properly include the dentist, what is the order of importance of work to be done for national health?

With greatest brevity may I list them by putting the following critical questions?

Is the water known by test and by sanitary inspection of source to be safe to use for drinking, personal cleanliness and food preparation?

Is all human and animal and household waste, from places of residence, work, play or travel, so disposed of as not to pollute water sources or foodstuffs, or to foul the soil where people may track dirt into homes?

Are all persons employed in trades and businesses, factories, shops and field so protected by physicians and their colleagues, the public health engineers and industrial sanitarians, that none suffer from avoidable environmental hazards of their chosen occupation? Not only for maximum production but for optimum quality and endurance of the workman, he and his employer are entitled to expert guidance in respect to the physical and psychic factors of each job or process.

Such protection, in addition to being a direct obligation of the employer whether individual, corporate or governmental, should be supplied where necessary by the local and state departments of health, through appropriate divisions or bureaus of occupational hygiene and sanitation.

Is all milk used fresh and fluid from healthy cows and pasteurized before delivery?

Does the diet of the average healthy child and adult include a quart or pint respectively of whole milk or its equivalent, about 40 per cent of the calories from whole wheat or enriched flour bread or the equivalent in whole grain cereals, an egg a day, a fruit and leafy vegetable, butter or its equivalent in other edible fat potato or its equivalent in rice or macaroni, and cheese meat or fish once a day?

Sugar and alcohol we can get along without and maintain the highest level of health. Sugar carries no hazard if used in moderation and as one of the

pleasant flavors of foods but not to an extent of replacing other carbohydrates of superior value. Sugar as a flavor tempts many to use it as a food. It is a very inferior food and not essential. Alcohol can be so used with food in moderation and in beverages of low percentage as to cause no obvious damage to health, but alcoholic beverages do not benefit health, and common experience shows how easily excess and habituation lead to accident, disease and deterioration of physical and mental fitness.

Few obligations of the physician are so obvious and permanent, and especially in war time, as that of counseling all both well and sick, in matters of nutrition and the judicious uses of foods and drink according to age, employment and conditions of climate.

The great and little things of human nutrition are well known medically and should convince us of the value of a general diet without excess and without deficits.

The dairy and the garden, the green grocer, fruiterer and milk man are the best sources of vitamins for normal people, and not the druggist or department store.

Increase in the occurrence of syphilis and of other venereally acquired communicable and preventable diseases is the most conspicuous recent experience of the men under arms and of young women of the civilian population who engage in commercial prostitution or clandestine extramarital sex indulgence. Unlimited and practically uncontrolled access to alcoholic beverages of all strengths by both military and civil patrons of the liquor trade is certainly a potent contributory factor in the increase of commercial prostitution and of the resultant rise in venereal infections.

There is no evidence that the considerable amount of physical and mental unfitness for military service found in the process of examining our millions of young men is due to neglect or inadequacy of medical services for the sick. Such a conclusion would be erroneous and misleading. The great majority of the men rejected for military service have been excluded for conditions in no way incompatible with the continuance of their normal civilian activities or affecting their standard of living. The causes of these rejections do not reflect on the adequacy of medical care of the sick in the United States but chiefly if not wholly on the lack of intelligence and initiative among the draftees who have failed to take advantage of the knowledge and medical and dental facilities well within their reach and means.

#### SUMMARY

I find that, with the single exception of the upward trend of venereal infection among a considerable and most precious fraction of our population, all evidence across the nation and from all levels of society is of an excellent present state of health.

To hold and better this requires a completion for every state and county of public health services now available to a majority of our people. Supplementing this must be an equally complete provision of professional and institutional services for the sick or of a kind widely but not everywhere provided.

Some basic requirements of general and industrial sanitation and of food usage are not everywhere or intelligently met.

We face no emergency of epidemic no threat of deterioration of our national health by any of the contributions we have been so far called on to make to a total offensive against the Axis powers.

National health in war or in peace is a personal matter. Public health is but the composite expression of a multitude of individual healths.

Health is our way of life guided as we may choose by the advice of that practical biologist, the general practitioner of medicine, supported in his efforts for the individual by the services of the community whose agent of preventive medicine is the trained medical officer of health.

Civilian health in our wartime is of a high order. We can lift it to new heights if we will for the duration and beyond.

## POLIOMYELITIS FOLLOWING TONSILLECTOMY IN FIVE MEMBERS OF A FAMILY

AN EPIDEMIOLOGIC STUDY

THOMAS FRANCIS JR., MD

ANN ARBOR, MICH

CARL E. KRILL, MD

AKRON, OHIO

JOHN A. TOOMEY, MD

CLEVELAND

AND

WALTER N. MACK, MS

ANN ARBOR, MICH

The K family of Akron, Ohio, consisted of father, mother and six children, E11, R9, J8, B7, M6 and L2½. In August 1941 they were well and active. On August 22 the five oldest children were subjected to tonsillectomy, the four oldest also had teeth extracted. On August 31 B7 took sick and became progressively worse. By September 5 the five children who had been operated on were acutely ill, all developed severe bulbar poliomyelitis, and by September 9 three of them had died. Two survived. The father, mother and one child who had not been operated on showed no signs of illness. These facts were reported by Krill and Toomey.<sup>1</sup>

The association of recent tonsillectomy and the bulbar form of poliomyelitis during prevalences of the disease has been recently summarized by Aycock.<sup>2</sup> In the present instance, however, the city of Akron (population about 270,000) was relatively free of poliomyelitis. Only 2 scattered cases had occurred prior to the onset in the K family, and no contact, direct or indirect, could be established. No subsequent epidemic occurred, although there were 6 additional cases in September. While the family associations were diffuse there was no recognized exposure to cases of known or suspected poliomyelitis. The present investigation was undertaken, therefore, in an effort to disclose the source of infection through epidemiologic studies combining both ecologic and laboratory approaches.

### FAMILY HISTORY

A review of the activities of the K family revealed numerous associations, which are detailed chronologically.

For a period of three weeks, beginning about July 1, 1941, the mother, father and four oldest children visited with an aunt (Ba) who lived on the shore of a small lake near Akron. The aunt was invalided with postencephalitic Parkinson's syndrome, and Mrs. K took care of her during the visit. The visitors were well during the holiday and returned home in good health.

The two youngest children, L2½ and M6, stayed during the same interval with an uncle and aunt (Be) in Youngstown, Ohio, 50 miles away. The Be family had two children, W5 and D3. During the last week of this period W5 was irritable, he was taken to a physician, who recommended tonsillectomy. At the same time the physician also examined the K girl, M6, and stated that her tonsils were badly infected, this observation was the starting point for subsequent procedures. The Be boy was operated on two days before the two K children returned home. Convalescence proceeded normally until the beginning of the third postoperative week, when the patient exhibited "general weakness," would not or could not eat well and had to be fed by his mother for about one week. Thereafter no abnormalities were noted. There was no further contact between the K and Be families except for a period of less than a half hour on August 20, when the Be family visited in Akron.

July 27 to 31 Mrs. K visited Fremont, W. Va. She traveled alone and encountered no children or any apparent sickness on the trip.

In the next few weeks nothing apart from the usual family activities is recorded.

August 16 to 18 Mr. and Mrs. K went fishing with friends in Danville, Ohio. All of the K children stayed for the two days at the home of a maternal aunt (McH), who lived about eight blocks away from the K family. There were four children, G9, C8, R7 and R6, in this family. An additional cousin, M12, of the same name but of a different household, visited with the group at this time but at no later date. No history of any illness was found in the McH family.

August 19 Mrs. K took the five oldest children to a physician for examination of their throats. It was recommended that all have their tonsils removed, and arrangements were made for August 22. That night the father had a headache and stayed home with the youngest child while all the others went to a ball game.

August 20 The Be family from Youngstown, Ohio, visited for a short time.

August 21 E11, J8 and B7 went picnicking and fishing with some friends at Eric Pond. The pond was located about eight blocks away, near railroad tracks. Approximately 100 by 50 yards, it was filled with rushes and stagnant water. Along the banks refuse was dumped, and garbage was floating in the water. Sewage did not drain into the pond, but the children reported having seen dead cats floating in the water. They ate their sandwiches on the bank, fished and waded in the water. On this day or a few days earlier B7 had actually tried to swim in the pond—the only person his associates had ever seen do so. One friend, RW (contact 22), fell in.

August 22 Tonsils and adenoids were removed by dissection from M6, B7, J8, R9 and E11, in that order. The latter four also had teeth extracted. The operations were performed with aseptic precautions under anesthesia with ether in a private hospital. An interval of approximately twenty minutes between operations was employed for sterilization of instruments, how the mask was treated was not clearly ascertained. The surgeon did not wear gloves but scrubbed thoroughly before each operation. One nurse assisted in operating, two others in the care of the patients.

Except for B7, whose tonsils were difficult to dissect free, the operative procedures went smoothly. After operation the patients were placed in a recovery ward. B7 vomited, none of the others did. After spending the afternoon in the hospital the children were taken home.

August 23 The children remained at home.

August 24 The entire K family called on the related LaP family, consisting of father, mother and two children, M14 and P10, who had been free of any signs of illness. While

Sponsored by the National Foundation for Infantile Paralysis, Inc. From the Department of Epidemiology and the Virus Laboratory, School of Public Health, University of Michigan, Ann Arbor, Mich.; Children's Hospital, Akron, Ohio, and the Department of Pediatrics, Western Reserve University School of Medicine, Cleveland.

<sup>2</sup> Aycock, W. L. Tonsillectomy and Poliomyelitis. I. Epidemiologic Considerations. *Medicine* 21: 65 (Feb.) 1942.

there another related family, LaB, father, mother and two children, K7 and D5, came in. The last mentioned children and the mother had experienced some gastrointestinal disturbance about two weeks earlier. The K children were quiet, and the entire visit lasted about one half hour.

It is of interest to note that the cousin, M14, had her tonsils removed on August 26 by the same operating team and at the same place as the K children. Convalescence was uneventful.

August 25 The children remained at home.

August 26 The children were more active, going in and out of the house. E11, J8 and B7 went with two McH cousins to a nearby wood and played with a group of neighborhood boys. There was a private fish pond with a constant waterflow. They all drank from it.

During the week the K children played with numerous children. On August 26, 29 and 30, J8 and B7 waded in Erie Pond. E11 delivered magazines to various homes including one in which a 1½ year old child (contact 27) subsequently developed a febrile illness. They did not enjoy food however, and ate mostly ice cream and liquids.

August 28 The children were all taken to the physician who examined their throats, considered their condition satisfactory and discharged them.

August 29 and 30 The MaA family visited in Kentucky from August 2 to 16. The oldest girl, L12 (contact 1), visited in Cleveland from August 17 to 24 with relatives, the MaB family, including three cousins (contacts 5, 6 and 7). Across the street from that home a fatal case of poliomyelitis had occurred, but no contact had been made. The week of August 25 to 31, after the return of L12 from Cleveland, all the MaA children (contacts 1, 2, 3 and 4) had severe diarrhea sufficiently severe to require camphorated tincture of opium U. S. P. for the youngest F3. From August 28 to September 2 two of the MaB cousins (contacts 5 and 6) visited. From August 28 to 30 the K children, E11, R9 and M6 played with the girls of the Ma families in rehearsing and putting on a play. This included fairly intimate association.

Another girl from the MaB family (contact 11) of Cleveland visited in Akron at the same time with a cousin (contact 8) of another branch of the Ma family (MaC). The latter girl had her tonsils removed in Cleveland on August 25. No ill effects ensued.

In addition, L2½, of the K family, played constantly with F3 (contact 4) of the MaA family. F3 also had coryza and fever on September 5, as well as the attack of diarrhea.

August 31 One of the K children, B7 was listless and refused to eat. The others seemed well. The family went to call on the aunt with whom the older group had stayed in July.

September 1 B7 complained of abdominal pain and vomited. The others played in the neighborhood.

September 2 Mrs. K telephoned the physician, who asked that B7 be taken to his office. Because the patient felt better that evening, it was not done. The other children played normally.

September 3 B7 was worse with continued vomiting. Mrs. K took E11, R9, J8 and M6 to register for school. J8 felt sick and went to bed. M6 complained of abdominal pain and loss of appetite. Some of their playmates played in the K house.

September 4 B7 seemed about the same. J8 and M6 were nauseated and vomited. The physician was called and suggested the possibility of poliomyelitis. The three children were put to bed. E11 complained that his 'throat felt funny' and had some difficulty in swallowing. B7 and M6 had no fever. J8 and E11 had 'slight' fever.

September 5 R9 took sick with abdominal pain, vomiting and pain in the back and left shoulder. E11 had nausea and vomiting. J8, B7 and M6 vomited more.

September 6 B7 could not move his left arm and complained that it felt 'creepy'. M6 developed dysarthria and dysphagia in the evening. R9 developed dysarthria, dysphagia and high fever. E11 developed aphonia and right facial paralysis and had difficulty in breathing.

September 7 Another physician was called and the five children were admitted to the Akron Children's Hospital with

a diagnosis of poliomyelitis. E11 became worse with palatal, cervical and diaphragmatic paralysis. No paralysis of the extremities was detected. Examination of his spinal fluid showed pressure 14 mm of mercury, 263 cells, 82 per cent of which were polymorphonuclear leukocytes, and protein, 80 mg per hundred cubic centimeters. R9 showed palatal and right facial paralysis, stiff neck and pain in the left shoulder, there was no paralysis of the extremities. Examination of her spinal fluid showed pressure 14 mm of mercury, 85 cells, 56 per cent of which were polymorphonuclear leukocytes, and protein 66 mg per hundred cubic centimeters. M6 became unconscious with bulbar palsy. Her spinal fluid showed pressure 6 mm of mercury, 38 cells of which 30 per cent were polymorphonuclear leukocytes and globulin a trace. J8 developed dysarthria and dysphagia, palatal paralysis, left facial paralysis and questionable involvement of the right quadriceps. His spinal fluid showed pressure 8 mm of mercury, 102 cells, of which 36 per cent were polymorphonuclear leukocytes, and a positive globulin reaction. B7 showed dysarthria with paralysis of the left side of the pharynx, left diaphragmatic paralysis and extensive paresis of all four extremities. His spinal fluid showed pressure 6 mm of mercury, 43 cells, 7 per cent of which were polymorphonuclear leukocytes, and globulin a trace.

September 8 E11 died at 6:30 a.m. R9 died at 3:30 p.m. M6 remained unconscious. B7 was very sick. J8 developed weakness of the right shoulder girdle.

September 9 M6 died at 11:30 a.m. B7 survived after a protracted stormy course. J8 survived after a severe but less hazardous course.

During this entire period the youngest child, L2½, and the mother and father remained well.

There were numerous other children with whom one or more of the K children played both before and after operation, with house to house visiting and close association. None of these developed symptoms or signs of poliomyelitis. Except for those already mentioned only two had any illness: one a cold and the other a mild gastrointestinal disturbance of one day's duration which was attributed to green apples.

#### VIRUS STUDIES

In an attempt to gain information concerning the possible source of infection, the dissemination of poliomyelitis in the community and familial associates, a collection of stools from 54 persons was made between September 9 and 17. Specimens were obtained in cardboard containers and kept in the frozen state with solidified carbon dioxide until prepared for animal inoculation. Since the major purpose was to identify reservoirs rather than to detail individuals, emphasis was placed on the children's associates. Furthermore, available information indicates that virus may be more readily recovered from the stools of children than from those of older persons.<sup>3</sup>

Stools were prepared variously, by the method of Kramer, Hoskwith and Grossman,<sup>4</sup> by that of McClure using duponol<sup>®</sup> or by simple treatment with ether and centrifugation.<sup>5</sup> From 10 to 15 cc of the fluid material was injected into the peritoneal cavity of a *Macacus rhesus* monkey and 2 to 3 cc given intranasally. If the material was well tolerated the dose was repeated on the third or fourth day and again a few days later. Temperatures were taken twice daily and the animal was thoroughly exercised each day. The animals were

killed and pathologic sections prepared In a certain number of animals suggestive signs were noted, passage to other animals was made for confirmation Animals with fever but without evidence of involvement of the central nervous system were killed, and microscopic sections of the brain and cord were made Only those were considered positive in which frank paralysis and typical pathologic changes ensued

Stools were procured from nine related adults and twelve related children, including the mother, father and surviving brother (table 1) The virus was identified in specimens from the well brother, from the two Be cousins from Youngstown, Ohio, and from four of the five McH cousins None was found in stools of any of the adult relatives

Negative results were obtained with specimens from the surgeon and the anesthetist and with pooled specimens from the three nurses

Stool specimens were obtained from twenty-eight playmates under 13 years of age, representing sixteen families, who (with the exception of the three MaB children from Cleveland, contacts 5, 6 and 7) lived within a radius of one block of the K family (table 2) Most of them played frequently with one or more of the K children both before and after operation Except for contacts 7, 8, 24, 25 and 27, the contact would be considered intimate, visiting in homes was common, and in many instances it was prolonged and repeated Pools of four, three, three and two specimens, respectively, by families were made to include twelve contacts, the remaining sixteen were tested individually The only positive result was secured with a pool from the three youngest children of the MaA family The oldest girl, who had visited in Cleveland, failed to yield virus

Other materials were obtained as follows  
(a) Dust from the mattress on which three of the K children slept, dust from bedrooms of the children and

(c) A sample of 7 liters of water was obtained from Erie Pond A 2 foot length of sausage casing was suspended in an upright position with a funnel tied into the upper end while the lower end was tied off The sac was filled with water and exposed continuously to an electric fan The procedure permits evaporation while retaining a low temperature In seventy-two hours the total volume was reduced to 170 cc The residual fluid was removed and treated with ether and duponol Great difficulty was encountered in ridding the water of bacteria The inoculated monkey died on the tenth day of bacterial peritonitis without histologic evidence of poliomyelitis

COMMENT

Our purpose in the present study has been not to emphasize again the presence of poliomyelitis virus in the stools of apparently unaffected persons but to attempt to gain evidence as to the source of infection and the sequence of events which led to the disastrous result in the five children whose tonsils were removed While the proportion of selected persons (at most 10 of 54) found harboring the virus in their gastrointestinal tracts was relatively small, when placed in perspective by the history the distribution of the positive results assumes considerable significance

There had been no recognized association with patients with acute poliomyelitis Nevertheless, the story of the Be cousin of Youngstown, Ohio, with whom the two youngest K children stayed for three weeks in July, is very suggestive The difficulty experienced by this child two weeks after tonsillectomy readily suggests a mild attack of poliomyelitis The K and the Be families had no further contact after M6 and L2½ left Youngstown except for a few minutes

two days before operation. The presence of poliomyelitis virus in the stools of the two Be cousins implies a closer relation than mere coincidence between this fact and infection of the visiting K children.

The next family, McH, with whom the K children actually lived was again one in which positive results were obtained. Virus was recovered from the stools of four of five cousins, who exhibited no recognized signs of illness. One of them, M12, had no contact with the K children after their operations. It seems not unreasonable to suggest that the McH family acquired the virus from their K cousins.

Among other associates the occurrence of positive stools was sharply limited to the MaA family, three doors away. It was thought that the oldest MaA child, L12, who had visited in Cleveland might have served as the source, her stool was negative. Furthermore, she returned to Akron only seven days before the first K child took sick. But a pool from the other three MaA children was positive. Among the older children of both families association was quite intimate—immediately preceding the operative procedures. Moreover, the youngest K child, L2½, who was found to harbor virus in his gastrointestinal tract, played constantly with the 3 year old MaA boy and may have served thus to transmit the virus.

The negative results among the remaining twenty-five playmates and other relatives is of interest in view of the fact that many of the former had intimate contact with the K children. It is clear that something more than contact must be invoked to explain the distribution of virus. While the factor of association between the K family and others yielding virus has been emphasized, it is intended to connote a closer intimacy than contact. In the present instance it meant living and eating together with all the related environmental features.

The relation of recent tonsillectomy to the development of bulbar poliomyelitis appears to be established.<sup>2</sup> In the present series the sharp limitation of paralytic disease in infected families to those on whom operations were performed clearly indicates that operation was the precipitating factor. This assumption would be translated to the case of the suspected cousin in Youngstown, Ohio. The sixth K child had virus in his stool, was not operated on and failed to show clinical evidence of infection. The remaining infected cousins also escaped. On the other hand, one cousin who was operated on at the same place four days after the K children remained well, virus was not recovered from her stool.

An indirect contact, 8, had her tonsils removed in Cleveland during this period. Virus was not isolated, nor did signs of illness occur. Tonsillectomy in an infected community does not seem sufficient. The more likely conclusion is, therefore, that tonsillectomy performed on an infected subject is the provocative factor. This is in agreement with Aycock's conclusion<sup>2</sup> based on a survey of cases and Sabin's conclusion derived from experimental results.<sup>7</sup>

It is of interest in view of experimental studies to consider the duration of the incubation period. It is assumed that incident to the trauma of operation the injured nerves are rendered more susceptible to infection and that the bulbar paralysis is related to direct extension of the virus along the cranial nerves. In fact Howe and Bodian<sup>8</sup> report certain experimental results indicating that in the first few days following

Activities of the K family and distribution of virus among their associates

nerve section the susceptibility of the motor cells to poliomyelitis is enhanced. Under such conditions the incubation period might be expected to be shorter than usual, especially since the distance the virus would traverse by axonal progression from pharynx to medulla is relatively short. The fact that the incubation period differs little in such cases from that encountered in the usual spinal type indicates that other factors are involved in determining the speed with which symptoms are induced.

The relative uniformity in the time of onset in the present cases suggests simultaneous infection. The onset of paralysis in the entire group occurred within forty-eight hours. Although the onset of symptoms in

B7 preceded the others by twenty-two, it may be recalled that his operative trauma was more severe, that he vomited postoperatively and that he complained of more constant pharyngeal discomfort than the others. It is true that B7 had frequented and swum in the filthy water of Erie Pond shortly before operation. On the other hand, contacts who accompanied him were not carriers of virus, and of doubtful significance is the fact that virus was not recovered from the water. There remains the possibility that the children were not all carriers of virus at the time of operation but that it was spread from child to child in the course of the manipulations. In this case M6, who was the first patient and had visited in Youngstown, would serve as the source. The frequency of virus instillation in the other families with positive stools would suggest, however, that a similar distribution had taken place in the K children before operation.

In an attempt to fit the available evidence into a single picture, the following sequence of events seems the most satisfactory. The Be cousin from Youngstown, Ohio, was carrying poliomyelitis virus at the time of his tonsillectomy in the latter part of July and developed a mild clinical attack of the disease. His sister was also infected, was not subjected to operation and escaped. The two youngest K children, M6 and L2½, acquired the virus at that time and served as the source of infection for the remaining children in the K family. The K children furnished the virus to the McH cousins, with whom they stayed for two days in August. The younger Ma A playmates were also infected from the K children in the latter part of August, while the older one, who was away until the week before operation, was unaffected. The operations incited invasion of the central nervous system in the five older children who were carrying the virus, while the physiologic equilibrium of the remaining child was undisturbed.

The study emphasizes the dangers of tonsillectomy during the months in which poliomyelitis is prevalent even though cases of the disease have not been recognized in the community. There was no indication that untoward effects might be anticipated in this particular group of children, who were in all probability undergoing an inapparent infection. The fact that other families were similarly infested without obvious harmful effects indicates that tonsillectomy served to transform a mild subclinical infection into a severe, fatal disease.

#### SUMMARY

Tonsillectomy was performed the same day on five apparently healthy children of the K family. All five developed bulbar poliomyelitis and three died. The sixth and youngest child was not operated on and remained well, although poliomyelitis virus was present in his stool.

Virus was recovered from the stools of two cousins, living in a city 50 miles away, with whom two of the K children had lived a month earlier. One of the cousins had difficulty, suggestive of poliomyelitis, following tonsillectomy. The evidence suggests that the virus was acquired by the K children during the visit.

Four additional cousins in another family group with whom the K children had subsequently lived were found to be carrying the virus without exhibiting any signs of poliomyelitis. They presumably became infected during the visit.

No virus was recovered from nine adult relatives or from cousins of two other family groups with whom contact had been casual.

Among twenty-eight playmates, many of whom had had intimate contact with the affected children, a group of three children in one family was found to be carrying virus.

The results indicate that a closer association than ordinary contact was involved in the transmission of the virus, but no virus was recovered from extrahuman sources.

It is clear that the operative procedure was the factor precipitating the severe bulbar form of poliomyelitis in children who otherwise would probably have escaped with inapparent infections. These observations emphasize again the dangers inherent in tonsillectomy during the season in which poliomyelitis occurs even though it is not notably prevalent in a community.

## PRODUCTION OF TETANUS IN GUINEA PIGS

BY SUBCUTANEOUS IMPLANTATION OF PELLETS CONTAMINATED WITH TETANUS SPORES

HENRY WELCH, PH D

GLENN G SLOCUM, PH D

AND

J J DURRETT, MD

WASHINGTON, D C

The administration of crystalline hormones by the subcutaneous implantation of compressed tablets or pellets, introduced by Deanesly and Parkes,<sup>1</sup> appears now to be an established clinical procedure when a prolonged uninterrupted action is desired. From the work of Deanesly and Parkes<sup>2</sup> and Thorn and his co-workers<sup>3</sup> it is apparent that this method of treatment will be greatly extended.

The implantation into the subcutaneous tissue of a hard compressed pellet accidentally contaminated with *Clostridium tetani* followed by subsequent healing of the wound sets up practically an ideal focus for the development of tetanus. Fildes<sup>4</sup> and Russell<sup>5</sup> point out that the germination of tetanus spores is dependent chiefly on the oxidation-reduction potential of the tissues. Heated spores alone when injected into guinea pigs do not cause the development of tetanus while the injection of spores mixed with sterile earth or calcium chloride results in the typical symptoms of this disease. Fildes considers that the oxidation-reduction potential of the normal tissue is sufficiently high to prevent germination of spores and that in areas of necrosis the potential falls to a point sufficiently low to permit their development. When tetanus spores are accidentally introduced into a wound, their germination with subsequent production of toxin depends largely on the presence of certain accessory factors, such as hemorrhage, trauma, certain types of chemicals and

the toxins of other anaerobes, all of which are conducive to the development of a lowered oxidation-reduction potential

The possibility of the development of tetanus through the introduction of pellets contaminated with tetanus spores may seem remote. However, the conditions necessary for germination of such spores are present, since the pellet constitutes a foreign body, which potentially can act as an accessory factor. Thus the subsequent production of necrotic tissue and lowering of the oxidation-reduction potential will result in tetanus if the pellets implanted, through some unfortunate circumstance, should become contaminated with *C. tetani*.

In the present report pellet implants have been made in a series of over 200 guinea pigs. For purposes of economy, and because its composition was similar to that of certain hormones used in subcutaneous implants, U S P cholesterol was used in the preparation of all pellets. Various concentrations of tetanus spores were incorporated in the pellets, and several antiseptics were used in certain pellets to determine whether they could prevent the development of the disease under the test conditions. These studies were undertaken primarily to determine the safety of such pellets, since it was quite apparent that they would be presented eventually for appraisal under the provisions of the Food Drug and Cosmetic Act.

#### METHODS AND RESULTS

In the preparation of the pellets 15 Gm of cholesterol was dissolved in 100 cc of U S P ether (for anesthesia) and then filtered through a Seitz filter. Some cholesterol is lost by this procedure. Tests for sterility of this filtrate were made by evaporating it to dryness and adding the residue to chopped meat medium. Under aseptic conditions 1 cc of the ether solution of cholesterol was placed in a sterile 20 mm glass shell vial approximately 25 mm high and evaporated to dryness in a sterile desiccating jar under partial vacuum in a 36 C incubator. Evaporation was complete usually in ten minutes. After evaporation the residue was carefully scraped from the bottom and sides of the vial with a pliable spatula and placed in a mold<sup>6</sup> and the pellet prepared. Pellets prepared in this manner weighed from 90 to 100 mg. Tetanus spores suspended in distilled water or the antiseptics in appropriate solvents were added to the cholesterol solution just before evaporation.

The tetanus spores prepared in chopped meat culture under Vassar seal were washed free from toxin with distilled water and then heated at 82 C for twelve minutes to destroy vegetative forms. The spores in the desired concentrations were added to the cholesterol solution suspended in 0.1 cc of distilled water in all instances.

For implantation of pellets, the hair was removed with electric clippers from an area about 4 cm in diameter on the right flank of the guinea pig. Under a local anesthetic an incision about 2 cm long was made through the subcutaneous tissue parallel to the spine anterior to the hip joint. Using blunt hemostatic forceps a subcutaneous pocket was prepared in the natural plane of cleavage between the skin and deeper structures which extended about 3 cm in the flank of the animal. A pellet was deposited in each pocket with sterile forceps, and skin clips were used to close the opening. The clips were removed usually after forty-eight hours.

In a preliminary experiment fifteen 90 mg pellets were prepared under aseptic conditions and ten were implanted in guinea pigs. The remaining five pellets were crushed under aseptic conditions, tested and found to be sterile. The wounds in the ten animals treated healed promptly, and there was no evidence of infection during the time the animals were under observation (two months).

After this preliminary work, pellets containing spores were implanted in a series of 30 guinea pigs, and for comparative purposes implants of gelatin capsules containing equivalent amounts of cholesterol and spores were made in a further group of 30. In each of the groups of 30 animals, 15 received concurrently an inoculation of 0.1 cc of a twenty-four hour broth culture of *Staphylococcus aureus* at the site of implantation. The concentrations of spores used were 100,000, 1,000,000 and 100,000,000. The results are shown in

Unassembled mold for preparation of pellets

table 1. In those animals developing tetanus, paralysis appeared first in the right hind leg (nearest to implanted pellet or capsule) but extended rather rapidly to the spine and other hind leg. The spine invariably arched to the right, and soon after this occurred the animals when placed on their sides could not get back on their feet without help. Usually within one to three days after the first sign of paralysis the animals died.

It will be noted (table 1) that of the 14 guinea pigs treated with pellets containing tetanus spores 3 of the 4 receiving 100,000 spores developed tetanus and died, 2 of the 5 receiving 1,000,000 spores developed tetanus and died while in the 100,000,000 spore group all 5 developed the disease and died. In the group of 15 animals in which implants of pellets plus tetanus spores were accompanied by inoculation of 0.1 cc of *Staphylococcus aureus* at the time of implantation, 13 animals developed the disease and died, 4 in the 100,000 spore group, 4 in the 1,000,000 spore group and 5 in the 100,000,000

<sup>6</sup> Instructions for construction of this mold were given us by G. W. Thorn, Johns Hopkins University, Baltimore.

spore group The 2 animals that survived in this group lost their pellets, one on the twelfth and the other on the sixteenth day During these studies it was noted that some of the pellets broke through the skin of the animals, and this was particularly true in those animals which developed a pus pocket at the site of implantation The combination of sharp edges on the pellet and softening and breakdown of tissue because of pus formation were conducive to pellet loss Both the remaining animals in this series were bled from the heart on the twenty-eighth day, and the serums were tested for the presence of tetanus antitoxin None could be demonstrated

In table 1 are given also the results of implants made with gelatin capsules containing the same amounts of cholesterol and spores as used in the pellets It will be noted that all 15 guinea pigs receiving capsules containing cholesterol and 100,000, 1,000,000 or

toxin could be demonstrated in this animal's blood serum In the 1,000,000 spore group 3 animals developed tetanus and died in five days, while the remaining 2 animals developed the disease and died between the forty-first and forty-fifth days Neither of the latter had demonstrable amounts of tetanus antitoxin in its serum All animals in the 100,000,000 spore group developed tetanus and died within six days

As a control on the effect of Staph aureus, pellet implants were made in an additional 10 guinea pigs Five of these animals were given sterile pellets but inoculated with 0.1 cc of a broth culture of staphylococci at the site of implantation The other 5 were treated with pellets containing 100,000,000 spores and 1 per cent phenyl mercuric acetate and inoculated also with staphylococci at the site of implantation The phenyl mercuric acetate was added to inhibit the development of the staphylococci Pus developed at the site of

|                     |                         | SP, severe paralysis      MP, mild paralysis      0 no symptom of tetanus      †, death from tetanus |   |    |    |    |    |    |    |   |    |    |    |    |    |    |    |    |    |    |    |            |

100,000,000 spores developed tetanus and died within five to ten days In these groups the capsule appeared to be dissolved completely within twenty-four hours after implants were made The wounds all healed cleanly within forty-eight hours Tetanus was first evident on the third day in the 100,000,000 spore group, on the fourth day in the 1,000,000 spore group and on the fifth day in the 100,000 spore group In the group of animals in which capsule implants were made and 0.1 cc of staphylococcus broth culture was injected at the time of closing the wound, an entirely different result was obtained Pus pockets were observed in all animals, and healing of wounds in those surviving was slow In all animals considerable of the cholesterol and apparently spores as well were exuded with the pus In the 100,000 spore group 2 animals died of tetanus within five days, 2 survived but showed no tetanus antitoxin in their blood serum and the fifth, although developing severe paralysis by the seventh day and remaining in this condition for one week, eventually recovered Small amounts of anti-

inoculation of all 5 of the first group, while those receiving pellets containing phenyl mercuric acetate showed no evidence of pus formation One of the animals receiving sterile pellets plus the staphylococcus inoculation lost its pellet on the eleventh day and died on the twenty-second day All others survived the wounds, eventually healing with elimination of pus However, although no pus formation was noted in the group of 5 animals in which pellets containing tetanus spores and phenyl mercuric acetate were implanted, all these animals developed tetanus, none surviving beyond the fourteenth day In order to determine whether antiseptics would have a delaying effect on the development of tetanus in guinea pigs, pellets containing 100,000,000 tetanus spores and 1, 0.5 and 0.1 per cent concentrations of phenyl mercuric acetate, hexylresorcinol, boric acid and azochloramid, respectively, were prepared and implants made in a group of 65 animals Five guinea pigs were used for each antiseptic at each concentration level, and 5 served as controls The last mentioned animals received

no antiseptic Each animal was inoculated at the site of implantation with 0.1 cc of a twenty-four hour broth culture of *Staph aureus* just before the incision was closed The results are given in table 2, where it will be noted that, although not offering protection against tetanus, phenyl mercuric acetate delayed the development of this disease in guinea pigs for several days beyond the time required for tetanus to develop in the animals treated with boric acid, azochloranid or hexylresorcinol or in the control group in which pellets free of antiseptic were utilized

In the group in which were implanted pellets containing 1 per cent phenyl mercuric acetate, 4 guinea pigs died of tetanus, one on the fourth day, one on the nineteenth day, one on the twenty-first day and one on the thirty-fifth day Two guinea pigs lost their pellets, one on the twelfth day and one on the fourteenth day The latter animal gave birth to a normal guinea

1, 0.5 and 0.1 per cent of phenyl mercuric acetate, respectively Three animals which received pellets without antiseptic served as controls, and as a check on the effect of the sulfonamide compounds implants were made in 15 guinea pigs of pellets containing 1,000,000 spores and 1.05 and 0.1 per cent sodium sulfathiazole All the animals in these groups were inoculated with 0.1 cc of a twenty-four hour broth culture of *Staph aureus* at the time the pellets were implanted Phenyl mercuric acetate again delayed development of tetanus, while sodium sulfathiazole appeared to have little if any delaying effect All animals in this series, including the controls surviving implantation of pellets contaminated with tetanus spores for two months lost their pellets while under study At each concentration level in the phenyl mercuric acetate group 1 animal developed tetanus and died while in the sodium sulfathiazole group 4 at the 0.1 per cent, 3 at the 0.5 per cent and

pig on the thirty-third day following implantation, showed paralysis on the thirty-fourth day and died on the thirty-fifth day The animal that lost its pellet on the twelfth day did not develop the disease Those animals receiving pellets containing 0.5 or 0.1 per cent phenyl mercuric acetate developed tetanus and died between the third and seventeenth days The animals receiving pellets containing 1 per cent boric acid developed tetanus and died by the eleventh day, while those receiving pellets with 0.5 or 0.1 per cent of this compound died of the disease in from three to five days, the same length of time required for the controls Those animals receiving pellets containing 1, 0.5 or 0.1 per cent concentrations of hexylresorcinol or azochloranid appeared to develop the disease and die even faster than the control animals which received pellets with no antiseptic incorporated but with the same concentration of spores

In view of the results obtained with phenyl mercuric acetate it seemed desirable to repeat tests with this compound Accordingly, implants were made in 15 guinea pigs with pellets containing 1,000,000 spores and

3 at the 1 per cent concentration levels developed the disease and died These results with sodium sulfathiazole are of interest in connection with the use of sulfonamide dusting powders and indicate the necessity for the sterility of such powders when they are used in deep wounds

The production of tetanus in guinea pigs through implants of sulfanilamide contaminated with tetanus spores is the subject of another paper

Following these results implants were made in a further group of 40 guinea pigs with pellets containing only 10,000 spores Twenty of the 40 pellets used in this series contained 1 per cent phenyl mercuric acetate Ten animals in each group of 20 were inoculated with 0.1 cc of a broth culture of *Staph aureus* at the time the pellets were implanted The results are summarized in table 3 It is apparent that phenyl mercuric acetate was again able to retard development of tetanus in these animals, as compared to the controls which

had been treated with pellets containing the same number of spores, particularly in those animals inoculated with staphylococci, although the retardation in these experiments does not appear to be as pronounced as in the earlier experiments, in which greater concentrations of spores were used

develop the disease Seven animals in the phenyl mercuric acetate group not treated with staphylococci developed tetanus and died by the thirty-sixth day, 1 showed no symptom of tetanus and survived, and 2 died during the experiment, apparently from causes other than tetanus

TABLE 2—Implants Made With Pellets Containing 1,000,000 Spores and Antiseptics—Staphylococci Inoculated

| Concen-<br>tration of<br>Antiseptic | Guinea<br>Pig<br>No | Days Following Implantation |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |          |    |    |    |            |  |

SP, severe paralysis

MP, mild paralysis

0, no symptom of tetanus

†, death from tetanus

Of the 10 guinea pigs in the phenyl mercuric acetate group that were inoculated with staphylococci, only 3 developed tetanus, 2 of these died and 1 recovered. The latter animal lost its pellet on the thirty-second day. One of the remaining guinea pigs in this group died with no evidence of tetanus, while the 6 remaining all lost their pellets by the thirty-sixth day and did not

In the control group of animals (those treated with pellets containing 10,000 spores but no antiseptic) approximately the same results were obtained whether or not staphylococci were inoculated at the time of implantation. Seven of the 10 animals that were not inoculated with staphylococci along with pellet implantation developed tetanus and died, 2 animals survived.

and 1 died without any symptom of the disease. Of those guinea pigs treated with staphylococci at the time of implantation, 8 developed tetanus and died, and the remaining 2 succumbed without symptoms of tetanus. Of interest was the fact that whether or not phenyl mercuric acetate was present those animals inoculated with staphylococci showed pus formation. It should be noted, however, that pus was present in the control group (no phenyl mercuric acetate) on the second day, while in the phenyl mercuric acetate group it was not evident until the seventh day. The staphylococci used in this experiment were somewhat more virulent than those used previously in this study.

## COMMENT

The implantation of compressed tablets or pellets in the subcutaneous tissue in the treatment of deficiency diseases presents a serious hazard if such substances are accidentally contaminated with tetanus spores. The introduction of a contaminated foreign body into the tissues and subsequent healing of the wound offers an ideal focus for the development of vegetative forms of *Cl tetani* and subsequent production of toxin. In this study the pellets used in most instances had rather sharp edges, which of themselves would be conducive to the development of necrosis, and this in turn may lower the oxidation-reduction potential and allow vegetation of spore forms.

In these studies it is apparent that pellets contaminated with tetanus spores implanted in guinea pigs will cause the development of the disease, whether as many as 100,000,000 or as few as 10,000 spores are present in the intact pellet. It should be noted that the spores responsible for development of tetanus in the guinea pigs used in this study were those that were washed from the surface of the pellets as they were bathed by the body fluids. The weight loss of these compressed pellets was extremely small over the two month intervals that the animals were under observation. Computation by most probable numbers of the numbers of spores on the surface of a group of ten pellets at one concentration level showed that the 10,000 spore pellet had from 200 to 300 spores on its surface. Of course, it is not possible to compute accurately the numbers of spores on the surface of a pellet of this type, on the other hand, it is obvious that considerably fewer spores were instrumental in the development of the disease than the total incorporated in the pellet when it was prepared.

When guinea pigs were inoculated with staphylococci at the site of implantation, in most instances more of the animals developed tetanus and in a shorter interval of time than when animals were treated with pellets contaminated only with spores. In some groups this was not the case, but in these it appeared that the formation of large amounts of pus plus the sharp edges of the pellet caused a breakdown of tissue which eventually resulted in the pellet working its way through the skin to the surface with subsequent loss of the pellet.

The use of antiseptics incorporated in the pellets during manufacture to prevent development of tetanus would appear to be a futile procedure. Although there are antiseptics which may inhibit spore vegetation, we know of none that can be depended on to destroy resistant spores. In addition, certain antiseptics have a definite toxic effect on human tissue which of itself would be conducive to the vegetation of spore forms.

In these studies, although only a few antiseptic substances were tried, it is obvious that certain of them incorporated in pellets with tetanus spores appeared to stimulate development of tetanus in guinea pigs sooner than in the control animals treated with pellets containing spores without any antiseptic. Phenyl mercuric acetate did delay development of the disease when incorporated in proper concentrations in pellets contaminated with tetanus spores, but this substance could not prevent development of the disease even though the number of spores in the pellet was reduced to 10,000, where the surface concentration of spores varied between 200 and 300.

It is apparent from these studies that pellets to be used for implantation in the body tissues should be sterilized during their preparation by an efficient filtration procedure or other effective process, handled aseptically throughout their manufacture and finally controlled by adequate check on their sterility. The process of implantation should be rigidly aseptic.

## SUMMARY AND CONCLUSIONS

Pellets contaminated with the spores of *Cl tetani* and implanted in the tissues of guinea pigs produce tetanus. The concurrent inoculation of staphylococci appears to hasten development of the disease.

The incorporation of antiseptics in such pellets is of no value since certain ones are conducive to the development of the disease, while others merely delay onset of symptoms.

The sterility of pellets to be used for implantation into body tissues should be assured during manufacture by proper filtration or other procedures and such sterility maintained by rigid aseptic technique.

**What Makes a Profession**—If there is such a thing as a profession as a concept distinct from a vocation it must consist in the ideals which its members maintain the dignity of character which they bring to the performance of their duties and the austerity of the self-imposed ethical standards. To constitute a true profession there must be ethical traditions so potent as to bring into conformity members whose personal standards of conduct are at a lower level and to have an elevating and ennobling effect on the members. A profession cannot be created by resolution or become such overnight. It requires many years for its development, and they must be years of self denial, years when success by base means is scorned, years when no results bring honor except those free from the taint of unworthy methods.—Shunaker W. A. Editor of *Notes*

A RURAL SHIGA DYSENTERY  
EPIDEMIC

F W CAUDILL, M D  
R E TEAGUE, M D  
AND  
J T DUNCAN, M D  
LOUISVILLE, KY

The county in which the epidemic discussed in this paper occurred is located in south central Kentucky. It covers an area of 400 square miles and is hilly, the soil being red clay to sandy with limestone rock formation. The total population, according to the 1940 U S Census, is 18,566, with 1,372 of this number living in the county seat, located about the center of the county. Approximately eight to nine families per square mile reside in the rural areas. Only about 6 per cent of the total population is Negro, about one third residing just outside the corporate limits of the county seat, while the other two thirds reside in scattered homes throughout the county.

The county seat has a filtered and chlorinated water supply drawn from nearby Russell Creek. Approximately 80 per cent of the homes in the town are connected to a sewage system which carries the sewage through a septic tank before it is discharged into Russell Creek below the intake of the water plant. The rural families get their water supplies from shallow wells, chiefly drilled, or from springs. Facilities for the disposal of excreta, when any are provided consisted only of privies, the overwhelming majority of which are open.

The annual mortality from diarrhea and enteritis per 10,000 of population in this county during the twenty year period from 1921 through 1940 showed wide fluctuations, as would be expected for a relatively small population. The rate reached 8 per 10,000 in 1923, fell to a low of 2 per 10,000 in 1924 and gradually again rose to 8 per 10,000 in 1929. From 1929 the general trend of the rate was downward to 2 per 10,000 in 1940. In 1941, through September, the rate showed a sudden rise to 8 per 10,000 population.

On the evening of June 11, 1941, a local physician reported to the health officer (J T D) that he had 3 very sick children in one family and thought that they had typhoid. The family was visited immediately by the health officer in company with the physician. On arrival at the home they found that 1 of the children had already died, that a second was in coma and that the third was extremely toxic. All had passed frequent bloody stools. The following morning it was found that another of the 3 sick children had died during the night and that 1 more child in the family had come down with the disease, bringing the total cases in this family to 4, with two deaths. Three other cases of what appeared to be similar illnesses were found in the families of two next door neighbors, bringing the total to 7 cases in this community.

On returning to his office the health officer received word that a child had died in another community about 1/2 mile from the first. Immediate investigation confirmed the report and revealed that 2 others in the same family were sick. All had passed frequent bloody

stools, their illnesses being similar in all respects to the cases in the first community.

Laboratory diagnostic facilities were promptly made available. The procedures used and observations made are discussed in detail in a report by Wheeler and his associates.<sup>1</sup>

Those patients with Shiga dysentery classified as having laboratory confirmation of this infection were (1) patients from whose stools the organism was isolated, (2) those from whose stools the organism was isolated and whose serums, in addition, agglutinated a known Shiga organism and (3) those whose serums agglutinated a known antigen and, in addition, had significant corroborative epidemiologic evidence of the infection.

A total of 38 cases gave such laboratory evidence of the Shiga organism being the etiologic agent. The remaining cases which were considered to be *Bacterium shigae* infections, are accounted for as indicated in table 1. From this table it will be observed that, in addition to the 38 patients with laboratory established cases, there were 43 who were direct contacts of patients with labo-

TABLE 1—Number and Percentage of Total with Specified Evidence for Diagnosis of Shiga Dysentery

|   | Patients | Percentage of Total |
|---|----------|---------------------|
| 1 Patients with laboratory evidence of Shiga dysentery infection  | 38       | 32.5                |
| 2 Patients who were direct contacts of those with laboratory evidence of Shiga dysentery infection  | 43       | 36.7                |
| 3 Patients who were indirect contacts of those with laboratory evidence of Shiga dysentery infection through intermediate persons sick at time of contact | 14       | 12.0                |
| 4 Patients who were next door neighbors or residing in the immediate vicinity of patients with laboratory evidence of Shiga dysentery infection           | 22       | 18.8                |
|   | 117      | 100.0               |

ratory proved cases, most of them family contacts and all with onsets within ten days after exposure to a proved case. Those not family contacts were persons who had visited in the homes of patients with proved cases and, accordingly, were considered to have been sufficiently exposed to have become infected. Most of the extrafamilial contacts in this group actually visited and ate in homes where there were proved cases. As indicated in this table, 14 more patients were contacts of persons suffering from dysentery who had, in turn, been in direct contact with proved cases of Shiga dysentery. In other words, these 14 patients were indirect contacts of patients with laboratory established cases. The remaining 22 patients were members of families living next door to or in the immediate vicinity of laboratory established cases, that is, in households located within a few feet to a few hundred yards of households in which there were proved cases, and because of habits of intermingling and sanitary conditions around their homes these patients could logically be assumed to have Shiga dysentery. That is, a total of 117 patients are considered to have Shiga dysentery because the condition

Dr Caudill is epidemiologist and Dr Teague assistant epidemiologist of the State Department of Health of Kentucky. Dr Duncan is the health officer of Adair County, Ky.

1 Ralph E. Wheeler, surgeon (R), C. T. Butterfield, principal bacteriologist, and William E. Burns, assistant bacteriologist, U S Public Health Service Cincinnati.

was either laboratory established or epidemiologically related to laboratory established cases.

With regard to the incubation period of Shiga dysentery in this outbreak, it is noteworthy that in 59 cases presenting a definite intimate exposure with a case of the disease within ten days prior to onset, the average number of days between first exposures and onsets was 5.3 days.

FIG. 1.—Mortality from diarrhea and enteritis per 10,000 of population in Adair County, Ky., from 1921 through September 1941 showing trend from 1929 through 1940.

As indicated in figure 2, it was found that the modal day of onset, when arranged according to the day of onset after first exposure, was the fourth day, with the fifth and sixth days after first exposure being the next most frequent days of onset. Onsets on the fourth day were numerous in cases in which there were family contacts.

The unusual severity of the dysentery immediately stimulated reporting throughout the county. Accordingly, a total of 224 cases of diarrheal disease were reported to the local health department during June, July, August and September. All these cases were investigated. Of the total, 117 cases were diagnosed as Shiga dysentery, the remainder were diagnosed as other types of dysentery—Flexner, Sonne and Hiss-Y making up those in which laboratory procedure demonstrated the presence of an organism of the Shigella group.

The 117 cases of Shiga dysentery were largely in families grouped in three distinct communities. Two of these communities were just beyond the northern corporate limits of the county seat, many of the men in both being employed at a lumber mill located in one of them. The third was 8 miles west of the county seat in and about a rural hamlet with a population of approximately 50. Only white families resided in these three epidemic areas. It was relatively easy to explain the spread in each of the three areas. As indicated in figures 3 and 4, in each of the three areas there were laboratory established cases of Shiga dysentery.

Apart from the two epidemic areas on the northern outskirts of the county seat, cases occurred in several families scattered in and around the town. Three of these families lived between the two epidemic areas and four others across town on the outskirts of the southwest corner of the city. Of the latter four scattered affected white families, three were in a small community in which resided four white and eight Negro families. In the Negro families, with one exception the members were all adults, mostly above 60 years of age. In the one family were 2 small children. This family, however, had a home that was well screened and tar above the average in cleanliness. On direct inquiry it was ascertained that there was practically no visiting between the Negro and white families. May it not

be that the lack of visiting between the white and Negro families and the absence of small children in the Negro families living nearby affected white families were the chief controlling factors in preventing spread of the disease to the Negro families?

The physical and sanitary characteristics of the two distinct epidemic communities on the outskirts of the county seat were quite similar. The houses were small frame or box structures of from two to four rooms, most of them in bad repair, badly kept and occupied by families who, with very few exceptions, were underprivileged and lacked facilities for even elementary cleanliness. The homes were located, for the most part next door to each other, on contiguous lots facing streets or roads. In the rural hamlet 8 miles west of town the homes, although similar in type to those in the affected communities near town, were mostly located on adjacent small farms rather than on adjacent lots. The attacked homes in all three communities either had no privies or had open back pitless privies or what had once been sanitary privies. Of the sanitary pit privies, all but one were in poor repair, with soiled floors and seats, and many of the pits were full to overflowing with excreta. With one exception, screens on the homes in all three communities were either absent, incomplete or ineffective. Flies were abundant in each of the communities, in fact, according to residents, unusually prevalent. Flies were plentiful inside all the homes except one, and, according to the mother in this home, this was accomplished by constant fanning them out and a continuous killing campaign inside the house.

All the attacked families but two obtained their water supplies from shallow drilled wells or springs. Only two attacked families lived inside the town and used city water. Because of the close proximity of

FIG. 2.—The modal and mean incubation period in 59 cases in which there had been definite previous exposure with a case of Shiga dysentery.

the homes in the two attacked communities near the county seat, the families had much in common. Many of the families were related to one another either by blood or through marriage, thus accounting for frequent interfamily visits. Nor was such visiting limited to blood relatives visiting and setting up with the sick being a common custom among neighbors.

With regard to cleanliness excreta were present on porches around outhouses, in open privy vaults and

on diapers. All this was accessible to flies, as were water and milk buckets, milk bottles, nipples, artificial and natural, and the bread and molasses on kitchen tables. Flies must have made the excreta of one household a common commodity in all households.

Contrasted with the two affected communities adjacent to the county seat was the epidemic area

Fig. 3—Map of Columbia, Ky., Adair County, with a population of 1,372. Black circles indicate attacked homes; black squares, cases of laboratory proved Shiga dysentery; white circles, nonattacked homes.

in the rural hamlet 8 miles away. Here, although the situation with regard to the condition of the houses, excreta disposal, flies, screening and water supplies were essentially the same as in other communities, the distances between homes lessened visiting and intermingling as well as rapid interchange of flies. Still, most of the attacked families in this community were related by blood or marriage. Intermingling among these families was less because of distances between homes and because of the lack of family transportation facilities. However, according to custom visits were made between families in time of illness, particularly related families in spite of inconvenience or distance. Thus significant direct exposure could be more often established, making direct contact the chief factor in the spread of the disease in this community.

Contact through visiting and intermingling was considered one factor of importance in the spread of the disease, with the lack of sanitation in and around homes another. As a means of further emphasizing the importance of these factors, a sanitary study of an equal number of attacked and nonattacked homes was made. Two trained sanitary inspectors working together surveyed both the attacked and the nonattacked homes. The nonattacked homes selected for the purpose of this study were located as near as possible to corresponding attacked ones except that none were chosen which had the same water supply. These control households were in the same vicinity as the attacked households, that

is on the next farm, within the next block or often next door. In comparing these two groups it was found that the sex distribution in the two was not different from that of the general population, but the number of children in the families constituting the two groups was significantly different, there being fewer children under 15 years of age in the control group than in the attacked group. This difference in the number of children in the two groups was obvious to the most casual observer. As there were fewer children, particularly children under 10 years of age, in control families, it is safe to assume that this is an important reason why the control families were not attacked.

It will be observed further from figure 6 that there was little difference between the two groups of households so far as concerns the pollution of water supplies as determined by bacteriologic examination. However, in contrasting the two groups with regard to excreta disposal, screens, fly prevalence inside and out, housekeeping and personal cleanliness, it was found that the control homes were much superior to the attacked homes. Thus in the attacked homes more children were living in a dirtier environment, with water being an equal hazard to the two.

This of itself would tend to rule out water as a factor in the spread of the disease. However, as further evidence that water was not a significant factor, it is to be noted that in the total of fifty-nine attacked households, their respective water supplies came from forty-nine different and more or less widely separated sources. It is very unlikely that the *Bacterium shigae* would

Fig. 4—Map of Adair County, Ky., with a population of 18,566. Attacked homes are shown by black squares indicating cases of laboratory proved Shiga dysentery, black circles, epidemiologically Shiga dysentery, white squares, laboratory proved other bacillary dysentery, white circles, epidemiologically other bacillary dysentery.

have found its way into all these different sources within the relatively short period during which cases occurred.

Of the fifty-nine attacked families, eleven used no milk at all, the remaining forty-eight families who used milk regularly or occasionally obtained their sup

phes from thirty-eight different sources, most of them from their own family cows and some from the family cows of neighbors. Very few of the infected families ever bought milk from a commercial dairy, the few who did occasionally or regularly buy dairy milk patronized no one dairy in particular.

Among the affected families fruits and vegetables taken raw came, for the most part, from family gardens. Commodities bought from stores were obtained from establishments so widely distributed around the county seat and in the affected neighborhoods as to make it entirely unlikely that the infection could have arisen from this source. Ice cream could not have been a factor, because it was a food rarely purchased and eaten by members of any of the families attacked.

The only thing in common between the first case that occurred in each of the two epidemic areas on the outskirts of the county seat was more or less continuous attendance at a carnival. The carnival, which had been attended by the first 2 patients prior to their onset of illness, had located within the area of the first epidemic community (fig 3) on May 25, five days before the onset of the first case.

On a lot immediately adjacent to the one on which the carnival had set up was encamped a band of gypsies. This band of gypsies was not a part of the carnival but pitched camp adjacent to it in order to take advantage of the crowd that would be drawn by the carnival. The clothes of a part of this band of gypsies were washed in the home, by the mother, of the first patient to have dysentery. Further, the first patient had, from the time the gypsies located, played around the gypsies' camp and had carried water for them. Approximately ten days before this gypsy band located at this place 2 children of a young gypsy mother in the band had been ill with what the informant thought was dysentery. One of the 2 children, an infant, had died, the older, a 3 year old child, recovered. Among the clothes washed by the mother of the boy who first became ill were those of this recovered child. The gypsies, while encamped near the county seat, used an insanitary pit privy that had been built on the adjacent county fairgrounds. There was ample evidence that they had also used for defecation a shed located near where they had set up. Flies were in abundance around the carnival and gypsy camp while they were located there, and little effort was made to protect food sold to the public at the carnival from these flies. The gypsies broke camp and headed east on May 30, the date of onset of the first case. With and as a part of the carnival were also some gypsies

who had on several occasions, talked with the mother and grandmother of the 2 gypsy children who had been sick, one of whom had died. It was from these informants that the history of the illnesses of the gypsy children was obtained. It was not until thirteen days after the gypsies had left the county that the disease was first recognized in the community. The gypsies had then had sufficient time to migrate a considerable distance away. It was not possible to get the names of the gypsies from the informants. A number of gypsy bands were interrogated throughout eastern Kentucky after the epidemic was discovered, but none admitted having stopped in the county.

From the onset of the first case on May 30 a total of 117 cases of Shiga dysentery occurred through June, July and the first three weeks of August, with the last onset recorded on August 21. Study of cases by day of onset showed no preponderance of onset on any one day of the week. When the total period over which the epidemic occurred is divided into seven day periods, Thursday through Wednesday, it is found that the incidence of the disease went up rather rapidly in the first two seven day periods, reaching a maximum during the third seven day period and maintaining a plateau over the third, fourth, fifth and sixth seven day periods. During the seventh week, onsets showed a sudden drop, which continued through the eighth week. During the successive five weeks only an occasional onset was recorded. The sequence of onsets is represented in figure 5.

From figure 5 it will be seen that the onsets of other types of dysentery in the county, when arranged by similar seven day periods, showed a gradual rise from the seven day period beginning May 29 through six successive seven day periods, reaching a sharp peak during the seventh week, then falling off rapidly through the succeeding six weeks. The peak week of onsets in the other types of dysentery was two weeks later than the second of the two peak weeks of onsets among the Shiga cases. This would suggest that the disease was introduced into the community and that the epidemic was superimposed on what probably was an ordinary prevalence of other types of dysentery.

Fig. 6—Comparison of insanitary factors found in 117 attacked homes (black columns) with 115 nonattacked homes (shaded columns) in epidemic area.

As indicated in table 2, in the family circles exposed to primary cases 20.7 per cent were attacked. The number of cases was too small when distributed according to age and sex, to show statistically significant differences between the various categories, but it will be observed that the higher rates were among males in the lower age groups. This is in general agreement with

other observations that have been made in the study of epidemics of bacillary dysentery

Furthermore, among the total of 117 patients, 72 were males and 45 were females. Assuming that the exposed population was composed of equal numbers of the two sexes, this difference is far beyond what would be expected on the basis of chance variation, the probability being about 100 to 1 against such an occurrence.

Twelve of the 117 cases resulted in death, giving a gross fatality rate of 10.3 per cent. Among the 72 male cases were nine deaths, giving a fatality rate of 12.5 per cent, among the 45 female cases were three deaths, giving a fatality rate of 6.6 per cent. By age, ten of the deaths occurred in the group under 10 years. Eight were boys out of the 33 boys in that age group, giving a fatality rate of 24.2 per cent. The 2 girls under 10 years of age who died were among 19 girls in that age group, giving a fatality rate of 10.5 per cent. Of the 2 persons over 55 years of age who died, 1 was a man (there were 4 men in this age group) and the other was a woman—the only woman over 55 who contracted the disease. All of the deaths occurred at the two extremes of life.

TABLE 2—Secondary Attack Rate Based on Total Population in Affected Families Less Primary Cases, by Sex and by Age Groups

| Age Groups | Total                                       |                         |                                | Male  |                         |                                | Female                                      |                         |                                |

| 10-19      | 75  | 15                      | 20.0                           | 40  | 11                      | 27.5                           | 35  | 4                       | 11.4                           |
| 20+        | 114   | 18                      | 15.8                           | 52  | 9                       | 17.3                           | 62  | 9                       | 14.5                           |
| Totals     | 271   | 56                      | 20.7                           | 132   | 31                      | 23.5                           | 139   | 25                      | 17.9                           |

Hence, the attack rate was higher among males. The fatality rate was greater among males. These differences, both attack and fatality, while not assuming wholly reliable statistical significance because of small numbers, collectively must have some significance. At least the difference suggests that males are more frequently infected or are more susceptible, one or both. Any definite answers to these questions, however, must await further study, both epidemiologically and immunologically.

CONCLUSIONS

1. Bacillary dysentery caused by *Bacterium shigae* was epidemic in a county in southern Kentucky during June, July and August 1941.
2. The infection was probably introduced by a band of gypsies.
3. The disease was superimposed on dysentery caused by other types of *Bacterium dysenteriae*.
4. After introduction, the disease was spread by (a) direct contact and (b) lack of environmental cleanliness.
5. The disease attacked males more frequently than females.
6. By age, the highest attack rate was in children under 10 and in males under 10.
7. The gross fatality rate was 10.3 per cent.
8. The disease was most fatal in children under 10, males under 10 and persons over 55.

INDUSTRIAL ILLNESS DUE TO  
TETRYL

REPORT OF 1,258 CASES  
LEON J. WITKOWSKI, M.D.  
CARL N. FISCHER, M.D.  
AND  
HOWARD D. MURDOCK, M.S.

Tetryl, or trinitrophenylmethylnitramine, was first described by Romburgh in 1883. Tetryl is similar to trinitrotoluene (TNT) in explosive power and is used as a military propellant. The production of tetryl in quantity dates with the first world war, when it was discovered to be the most efficient initiator of explosives. Tetryl possesses the advantage that the raw materials needed for its manufacture do not deplete the materials required for the manufacture of other explosives.<sup>1</sup>

Tetryl is blended with either graphite or stearic acid as the binding element so that it can be pressed into pellets, the form in which it is most frequently used in munitions. Our experience has been with crystalline tetryl blended with stearic acid.

In the first world war the occupational hazards of tetryl were not fully appreciated in this country because medical investigation could not keep pace with the stress of emergency production. With the termination of the war, tetryl production in quantity ceased and much of the medical investigation that had been initiated was abandoned. At the start of the second world war, improved technical procedures allowed the production of a constant quality tetryl. The use of great quantities of tetryl has introduced a new occupational hazard and has created a challenge to industrial medicine.

A knowledge of the varied symptoms of tetryl illness is becoming increasingly important to the medical profession. This is of concern to private physicians in defense areas as well as the industrial surgeons stationed at shell loading plants. Despite constant observation, a number of employees, in the absence of the typical dermatitis, will visit their family physician complaining of vague systemic symptoms. A short history will direct the examining physician's attention to the etiologic factor.

Past literature indicates the common belief that tetryl toxicity consists essentially of local manifestations.<sup>2</sup> We are not in full agreement with this thought. Since the local symptoms are by far the most commonly encountered, they shall be described first. Employees handling tetryl powder often develop a yellow staining of the hands, which is then frequently carried to the face and hair. In industry the terms "canary" and "tetryl blond" are frequently used to describe this yellow staining of hair, scalp and face. This staining or discoloration is not indicative of tetryl illness or dermatitis. The true pathologic tetryl dermatitis is the most common symptom of tetryl illness. In a study of 1,258 workers affected by tetryl the presenting symptom in 944 of them was a dermatitis. Tetryl dermatitis most commonly occurs on the face, particularly in the circumocular region, on the lateral surfaces of the neck and less frequently in the antecubital fossae and on the dorsal portions of the forearms. The dermatitis generally occurs between the second and third week of exposure,

<sup>1</sup> Bam, C. J. Army Ordinance VI, No. 36, 1926.  
<sup>2</sup> Smith, E. Brit. M. J. 1: 618, 1916. Cripps, L. Brit. J. Dermat. 29: 3, 1917. Ruxton.<sup>3</sup>

and the first subjective complaint is that of itching and burning of the affected parts. The dermatitis appears as an erythematous area associated with varying amounts of edema. This condition is most pronounced in the circumocular region and is characteristic. Closer examination discloses a glistening, shiny appearance of the epidermis. In its milder form the dermatitis is not unlike a second degree sunburn and with progression in the more severe forms there are drying and desquamation of the epidermis which may lead to areas of serous exudation (fig 1).

Epistaxis is a common and early complaint, occurring most frequently in the early waking hours. On examination, the bleeding points could be traced to small ulcerations of the nasal mucous membrane in many cases in that area anterior to the inferior turbinate.

Frequent complaints are sneezing, coughing without production and pain in the chest. These symptoms generally occur during the first two weeks of exposure and are the frequent forerunner of tetryl dermatitis. Anorexia, mild nausea, flatulence and abdominal cramping are also common complaints and occur in 10 per cent of all exposed workers. Most frequently epistaxis and dermatitis occur together.

anemia of a rather pronounced degree is becoming increasingly apparent. Other symptoms suggestive of systemic illness such as headache, irritability, malaise, lassitude and sleeplessness, are frequent complaints. Irregularity of menstruation is frequently observed in cases of tetryl illness. This we cannot attribute to a purely local action.

Of the 1258 cases surveyed in this study, 3 have been sufficiently severe to require hospitalization. This small percentage emphasizes the importance of prompt medical care with the presenting symptoms. In all 3 instances the history revealed a previous attack of severe tetryl dermatitis which cleared slowly when the employees were removed from contact. After the subsidence of symptoms 2 of these people were accidentally reexposed to tetryl and a severe reaction promptly recurred. This has created a standing rule at this plant that persons with unusually severe tetryl dermatitis are removed permanently from tetryl exposure.

#### REPORT OF A TYPICAL CASE

Miss A. H. aged 24 who had worked as a tetryl operator for three weeks first reported to the Central Medical Unit on April 7, 1942, complaining of recurrent nosebleeds and a rather severe dermatitis involving the circumocular region,

Fig 1—Severe form of tetryl reaction showing drying and desquamation of the epidermis leading to areas of serous exudation.

All these manifestations are believed to be due to direct local contact of tetryl powder on skin or mucous membranes. Tetryl, like trinitrotoluene, is fat soluble and consequently is thought to have a predilection for those areas of skin most heavily invested with sebaceous glands.

The exact reasons why tetryl causes these symptoms are not definitely known. There are two theories most often mentioned: direct mechanical and chemical. Examined under the microscope, tetryl seems to be composed of finely divided crystals liable to fracture, the broken ends being sharp. These physical characteristics of tetryl powder were believed to be the mechanical cause of the manifestations described. The chemical theory is based on a possible oxidizing reaction of tetryl on the skin. The greater probability that tetryl illness is caused by general or local sensitization to tetryl deserves more serious thought.

At the present time, as mentioned previously, tetryl is believed by many to cause only local manifestations. We have found increasing evidence to point toward the probability that the problem is not as simple as it appears. Systemic changes are believed to be quite possible. In our preliminary laboratory data secondary

the volar surfaces of the forearms and the antecubital fossae. Because of the severity of her reaction it was decided to remove her permanently from tetryl contact. She was given the usual treatment of calamine lotion and mild saline purgatives. She continued to progress favorably, and the dermatitis subsided spontaneously. On April 13 she was accidentally reexposed to tetryl dust when she entered a change house station which was filled with tetryl operators in powder suits. She again reported to the Central Medical Unit, this time exhibiting severe edema in the circumocular region and a dermatitis of the volar surfaces of the forearms. Because of the severe itching and intense burning she was hospitalized for study and symptomatic treatment.

On entrance examination of the urine was negative for sugar and albumin; the specific gravity was 1.010 and the results of microscopic examination were unremarkable. The red blood cell count was 400,000 and the white blood cell count 13,100 with a differential count of 75 per cent neutrophils, 17 per cent lymphocytes, 2 per cent monocytes, 4 per cent juvenile forms, 1 per cent basophils and 1 per cent eosinophils. The hemoglobin content of the blood was 81 per cent. Chemical examination of the blood revealed nonprotein nitrogen 26 mg, sugar 79 mg, chlorides 484 mg and calcium 19.87 mg per hundred cubic centimeters. The icteric index was 4.2.

She remained in the hospital for nine days, at the end of which time the temperature, pulse and respiration were normal. Subsequent laboratory work revealed no changes in blood

constituents of the blood, but there was a slowly developing anemia, as shown by 3,100,000 red blood cells, 5,200 white blood cells and 68 per cent hemoglobin. This anemia responded promptly to ferrous sulfate medication.

This case is of interest because it again emphasizes the fact that when an operator exhibits signs of a severe tetryl reaction he is best removed from tetryl contact permanently. Employees with the milder forms may be allowed to return to their original positions if they are under constant medical inspection. It also emphasizes the possibilities of an increasing sensitization to tetryl in cases of originally severe reactions and raises the question as to the cause of the secondary anemia.

This apparent increase in sensitization has discouraged the routine procedure of skin testing potential operators.

Fig 2—There are two factors having an apparent correlation with the weekly incidence of new cases of tetryl reactions: the amount of tetryl used and the increase in exposed population.

It is now generally believed that patch testing possibly serves as a means of sensitizing and consequently might prove to be more dangerous than beneficial.<sup>4</sup>

STATISTICAL STUDIES

Out of a total population of more than 5,000 people working in buildings where tetryl is processed, we have found that 1,258 (23 per cent) have suffered from symptoms of tetryl illness. Of these 1,258 75 per cent developed a definite tetryl dermatitis. We found in detailed statistical studies of more than a thousand cases that neither age nor sex could be considered definite predisposing factors to tetryl illness.

Forty per cent of operators in direct manual contact with tetryl develop some evidence of tetryl illness. Ruxton,<sup>5</sup> in studying contact operators, found that 32 per

cent of workers could be affected. Twenty per cent of operators working in the same building but not in direct manual contact with tetryl develop tetryl illness. This fact definitely proves that we are not concerned alone with direct contact.

The great demands of the country's war efforts interest the industrial surgeons because it is graphically shown that the number of new cases of tetryl illness is usually proportionate to the amount of tetryl used in production within a particular tetryl unit.

Employees usually experience the first symptoms of tetryl illness during their second or third week of exposure.<sup>6</sup> This figure approximates 1 per cent of the entire line population. During the following weeks there is a gradual increase in the percentage of new tetryl cases until the maximum is attained, at the fifth or sixth week, which approximates 5 per cent. From the sixth week on the percentage of new cases gradually recedes to a maintained average of 3 per cent. These percentages suggest the development of an apparent tolerance. It is this working group, which has been exposed to tetryl dust exceeding six weeks, which we expect to be the working population of tetryl lines.

PROPHYLACTIC MEASURES

All measures directed toward the prevention of tetryl illness should be primarily concerned with the control of tetryl dust.<sup>6</sup> At this plant we have processed crystalline tetryl blended with stearic acid. We have reason to believe that granular tetryl with graphite blend may be a big factor in reducing the amount of tetryl dust. Our figures show that operators need not be in direct manual contact with tetryl to suffer from its ill effects. Among our many cases of tetryl illness we have had repeated instances that emphasize the importance of reducing tetryl dust in the production buildings to a minimum. We have had the importance of tetryl dust accentuated by the development of a typical moderately severe tetryl dermatitis in a nurse who worked in a first aid station isolated from any tetryl building. The only etiologic factor could have been a dust contact from employees who worked with tetryl. The mother of one of our employees visiting in his home for a few days developed a typical tetryl dermatitis.

1 *Rotation of Employees*—Since we have seen that tetryl illness most frequently occurs between the second and third week of exposure, we suggest the weekly rotation of workers in direct manual contact.<sup>5</sup>

2 *Assignment of Open Operations to Rooms of Small Capacity*—It is advantageous that certain tetryl operations should be carried on in small accessory rooms rather than in large rooms housing many employees. This will reduce the amount of tetryl dust in the entire unit. These operational procedures, for example, would be the placing of tetryl pellets into booster cups, hand drilling, reconsolidation, and so on.

3 *General Cleanliness of Employees*—The use of powder uniforms which adequately clothe the extremities and includes a cap will do much to avoid unnecessary contact. These uniforms should be particularly chosen to avoid restrictive cuffs about the ankles or wrists which could lead to undue friction. The daily laundering of these uniforms should be mandatory. Provision of adequate shower facilities for employees, particularly those in direct contact, is worth while. The value of the shower following the working period should not be left to the employees' discretion.

<sup>5</sup> Ruxton, W. L. Brit J Dermat 29: 18, 1917.

<sup>6</sup> Silver, A. L. L. J Roy Army Med Corps 71: 87 (Aug) 1933.

4 *Ventilation and Temperature Control*—Forced direct circulating air currents should be eliminated to prevent the dispersion of tetryl dust. Many cases can be traced directly to negligence of this problem. The temperature should be maintained at a 72 F maximum.

5 *Dietary Measures*—Little has been said in past reports on dietary measures for the prophylaxis of tetryl illness. Other writers have suggested that the use of milk in quantities of 2 pint portions during the eight hour working period may be used as a prophylactic measure against tetryl illness. We have been unable to find as yet any specific or definite reason why milk would protect one against tetryl illness in any of its manifestations. It might serve some mechanical purpose in reducing gastrointestinal complaints but we have failed to substantiate this. Workers suffering from symptoms of gastritis have been instructed to eat an adequate meal prior to their working period. This has given good results.

At the present time there are many suggestions as to the value of concentrated vitamin C to employees on production lines of both tetryl and trinitrotoluene. We do not believe there is sufficient evidence to warrant dispensing this drug to such workers.

6 *Protective Skin Cream*—A protective skin cream was used in an experimental group to study the effi-

ciency of such preventive measures.<sup>1</sup> This cream is composed of 10 per cent zinc oxide and 1 to 2 per cent ferric oxide in a water miscible casein base. The face and neck cream is colored with brown ferric oxide to give a light tan color, and the hand cream contains red ferric oxide. This makes possible rapid inspection on the lines to verify its use. The protective cream is applied to the hands, face and neck before the start of the work period and after the lunch recess. The operators are cautioned to remove the protective cream before lunch and after work by thorough rinsing under cool water.

For the purpose of controlled experiments the cream was used in two groups of operators working in separate buildings. Each group was divided into three sections. Section 1 was given hand cream only. Section 2 was given hand and face cream. Section 3 was untreated for control purposes. The results are given in the accompanying table.

There was a decrease of approximately 50 per cent in the weekly incidence of tetryl dermatitis when the protective cream was used.<sup>2</sup>

#### ACTIVE TREATMENT

The certain treatment of tetryl illness is, of course, removal from contact. This is often neither practical nor entirely advisable. In most cases of mild gastrointestinal complaints or mild dermatitis an attempt is made to keep the employees working under conditions

of moderate exposure.<sup>3</sup> As many as 60 per cent of these employees develop an apparent tolerance, and a working population is thereby established. We strongly advise that those who in their primary illness develop a severe reaction are permanently transferred from any contact with tetryl. The treatment of the dermatitis consists in the application of calamine lotion without phenol<sup>4</sup> and in cases in which there is some desquamation the use of moist aluminum acetate dressings is still the honored remedy. Burning of the nasal mucosa is most relieved by the intranasal application of zinc oxide ointment and our workers are frequently given small amounts for intranasal insertion prior to their working day. We wish to reemphasize the possibility of a secondary anemia in employees who have persistent complaints. This anemia is quickly remedied by the removal from contact with tetryl and the administration of ferrous sulfate. Those complaining of gastrointestinal symptoms should be questioned closely as to their eating habits prior to their coming to work, and it will be frequently seen that those who have complaints are the coffee and doughnut breakfast eaters.<sup>5</sup>

#### COMMENT

From the results of these investigations it is apparent that the increased use of tetryl will result in a great number of cases of industrial illness with which many physicians have heretofore been completely unfamiliar. The incidence of tetryl illness in our series may seem unusually high but we believe that a similar incidence will be found in the early days of production at all shell loading plants under similar conditions.

If the precautions which we have cited are rigidly followed a good deal of illness and lost time can be prevented. The importance of close, conscientious medical supervision of employees dealing with tetryl cannot be overemphasized. It is this surveillance which allows a majority of employees with tetryl illness to continue at their work until 60 per cent of them develop an apparent tolerance which makes possible uninterrupted production. Our investigations definitely emphasize that any one in a tetryl building is subject to illness. Earlier literature has usually considered only operators in direct contact with the substance.

We wish to stress our feeling that tetryl illness is not confined to purely local symptoms. Our cases of rather rapidly developing secondary anemia,<sup>6</sup> increased irritability and pronounced anorexia cannot be ignored. We strongly suspect that tetryl in cases of prolonged exposure could cause renal or hepatic damage, but we have as yet been unable to substantiate this view.

As has been mentioned employees with mild tetryl dermatitis or illness are allowed to continue their work. We have found that it is to our advantage to remove those with severe primary dermatitis from tetryl contact permanently. The 3 employees who required hospitalization had severe primary reactions and 2 of them were accidentally reexposed.

The problem of tolerance and increased sensitization<sup>7</sup> is a delicate one and it is best interpreted by the examining physician who comes in contact with a multitude of cases. Certainly the reactions which we have seen cannot adequately be explained by either the local chemical or the local mechanical theories. It should be recognized that tetryl dermatitis or any symptom of tetryl illness is based on a sensitization of the body to the provoking agent.

3 Schwartz, Louis. *Indus. Med.* 10: 373 (Ser. 1) 1941.

4 Phenol sensitivity has frequently been seen here.

7 A communication dealing with more general use of the protective cream with secondary anemia and with sensitization will follow.

IMPORTANCE OF RECTAL EXAMINATION IN THE PROGNOSIS OF RECTAL CARCINOMA

EDWIN W SHEARBURN, MD  
UNIVERSITY, VA

The rectum is a relatively common site for the appearance of carcinoma. Carcinoma of the rectum ranks fifth in the incidence of carcinoma of the human body and second only to that of the stomach in carcinoma of the gastrointestinal tract. It accounts for approximately 60 per cent of all intestinal carcinoma and approximately 5 per cent of all of the carcinoma in the body.<sup>1</sup> Carcinoma of the intestine, rectum and anus ranks third in the causes of death from cancer in Virginia.<sup>2</sup>

Carcinoma of the rectum is curable in a high proportion of cases when treated early. Five year cures have been reported in as high as 43.8 per cent<sup>3</sup> and 46 per cent<sup>4</sup> of cases. The operability of rectal carcinoma varies with individual clinics, having been reported in between 50 and 75 per cent with a tendency to increase in later years.<sup>5</sup>

The purpose of this paper is to point out some of the obstacles to cure of carcinoma of the rectum and to emphasize the manner in which these obstacles may be overcome.

One hundred consecutive cases of carcinoma of the rectum treated at the University of Virginia Hospital during the past ten years have been reviewed and tabulated according to the number which were adequately examined by local physicians prior to diagnosis in this clinic. Since practically all of the tumors in this series of cases were palpable from below, for the purpose of this study an examination has been considered adequate if the local physician had performed a digital examination of the rectum. It is, of course, understood that in all cases digital examination should be supplemented by anoscopic and proctoscopic examination with sigmoidoscopic examination, barium enema and biopsy when indicated. Almost none of the patients here reported on had had these additional studies before being seen in this clinic.

In addition, these patients have been studied as to operability and the method of treatment of both the operable and inoperable patients. The criteria for inoperability have been those related to the lesion itself rather than to general conditions, that is, the size and extension of the local growth and the presence of regional, hepatic, pulmonary or even more remote metastases. The patients have not been classified as inoperable because of age, cardiovascular disease or renal disease.

Table 1 demonstrates the relatively low proportion of cases in which an adequate examination was per-

formed by the local physician and also the extremely high proportion of cases in which the examination by the local physician was inadequate and the lesion was not diagnosed until the patients were examined at this clinic. It will be noted that in only 36 per cent was the examination by the local physician adequate and in 33 per cent an entirely inadequate examination had been performed by the local physician. A great majority of these 33 patients were treated symptomatically with ointments or suppositories for their rectal complaint, or in a number of instances when hemorrhoids were the presenting finding hemorrhoidectomy without further examination had been performed. In 26 of the case histories it was impossible to tell with any degree of certainty whether an adequate examination had been performed by the local physician. These patients were listed as questionable. Five patients did not consult local physicians and came directly to this hospital for diagnosis and treatment.

TABLE 1—Rectal Examination Prior to Diagnosis at the Clinic

|                          |     |
|--------------------------|-----|

| Other treatment  |          |          |
| Irradiation and excision or radiation plus perineal excision | 6        |          |
| Refused operation  | 5        |          |
|  | 33       |          |
| Inoperable   |          |          |
| Colostomy  | 32       |          |
| Colostomy plus radiation                                     | 8        |          |
| Radiation  | 6        |          |
| No treatment given   | 4        |          |
|  | 50       |          |
| Operability questionable and exploration refused             | 12       |          |
|  | 100      |          |

In chart 1 the data have been grouped according to the adequacy of examination of the patient by the local physician and the percentage of operable, inoperable and doubtfully operable patients in each group. It will be noted that the highest percentage of operable patients, except for the small group that came directly to this hospital for treatment, occurs in the group who were adequately examined by the local physicians. In this group 47 per cent were operable and 47 per cent were inoperable. In 6 per cent the operability was questionable but exploration was refused. In the group of patients who were inadequately examined by their local physicians only 36 per cent were operable, while 46 per cent were inoperable and in 18 per cent operability was questionable and exploration was refused. The lowest percentage of operability occurred in the group whose examinations by local physicians were questionable. In this group only 23 per cent were definitely operable, 62 per cent were definitely inoperable and in 15 per cent operability was doubtful and exploration was refused. It is probably significant that the highest percentage of operable patients occurred among those who were adequately examined by local

Cattell<sup>3</sup> Jones<sup>4</sup>

physicians and that the rate of operability was considerably less in patients who were not examined by local physicians. It may also be of significance that the lowest percentage of operability occurred in that group in which examination by the local physician was doubtful and that the highest percentage of inoperability occurred in this group. One might infer from these observations that the majority of this group had not been adequately examined by local physicians. The last group of 5 cases is so small that the high rate of operability 60 per cent is probably of no significance.

In chart 2 the patients have been grouped according to operability. They have been divided into the operable group, the inoperable group and a third group in which the operability was doubtful and exploration was refused. Each group has been further subdivided according to adequacy of examination by the local physician. The rate of operability for this entire series, 38 per cent, is relatively low and is considerably less than in most individual series represented. However, this may in part be explained by the fact that this hospital cares for a large number of indigent patients and that a relatively large proportion of these patients probably endure their symptoms for many months before consulting a physician.

It will be noted among the group of operable patients that 45 per cent had had adequate examinations by local physicians. Thirty-two per cent of these were not examined adequately by local physicians. In 16 per cent the examination was doubtful, and in 7 per cent no local physician was involved. Among the group of inoperable patients only 35 per cent had had adequate examinations by local physicians, 30 per cent were inadequately examined, in 32 per cent the examination was questionable and 4 per cent had had no local physician. In the group of patients for whom operability was doubtful but exploration was refused, 18 per cent had been adequately examined, 50 per cent had had

probably of no significance. Of the operable patients there was some question as to examination by local physicians in only 16 per cent, there was some doubt as to examination in 32 per cent of the inoperable group and in 32 per cent of the group in which operability was doubtful. The higher percentage of operability in that small group who came directly to the hospital is probably of no significance.

Chart 2—Data on patients grouped according to operability and charted in percentage of adequate examinations

Table 2 presents data arranged according to operability of the patients and to the type of treatment employed. It will be noted that a total of 27 underwent resection, with 2 deaths, or a mortality of 7.4 per cent. Six were treated in some other manner, such as fulguration and excision or radiation plus perineal excision. There were no deaths in this group. Five of the patients who were thought to be definitely operable by clinical examination refused operation. Of the inoperable patients, 32 were treated by colostomy alone, 8 were treated by colostomy plus radiation and 6 by radiation alone, for 4 it was thought not advisable to carry out any treatment. For 12 patients there was some controversy as to the operability, and all of these refused exploration. Including the 5 patients who were thought to be definitely operable, a total of 17 patients or 17 per cent of the series, refused treatment. This is a slightly higher incidence for refusal of treatment than most authors report.<sup>4</sup>

#### COMMENT

The foregoing data emphasize the importance of an ordinary digital examination of the rectum at the earliest opportunity once the patient consults a physician with the history of change of bowel habits and/or blood and mucus in the stools. It seems reasonable to assume that of the 15 patients who were inadequately examined by their local physicians and who were found to be inoperable at the time of examination at this hospital a majority might have obtained the benefit of curative surgery had the diagnosis been established at an early date. Other authors<sup>6</sup> have indicated an even higher percentage of unfavorable cases as being directly the result of incomplete examination. Jones<sup>7</sup> estimated that the local physician was at fault in 85

Chart 1—Data on patients grouped according to adequacy of examination and charted in percentage of operability

inadequate examinations by local physicians and 32 per cent presented no clearcut history indicating whether adequate examination had been performed or not. It is probably significant that the adequacy of early examination was greatest in the group of operable patients. However, the percentage of patients who had inadequate examinations is approximately the same in the operable and inoperable groups. The highest percentage of inadequate examinations occurred among those patients in whom operability was doubtful. This is

<sup>7</sup> Jones T E. Early Diagnosis and Treatment of Cancer of the Rectum. *South M J* 34:35-38 (Jan.) 1941.

to 90 per cent of unfavorable cases. Other authors<sup>8</sup> have stressed the importance of an educational program for general practitioners as well as for the lay public concerning the importance of early diagnosis in carcinoma of the rectum.

Examples among this group of cases of inadequate examination by the local physician may be cited. A 51 year old white woman had had rectal discomfort with bleeding and alternating periods of constipation and diarrhea for nearly three years. She was treated by hemorrhoidectomy by the local physician without being given an adequate examination. In addition, she was treated for one month postoperatively by a second physician for rectal stricture without the diagnosis of carcinoma of the rectum being made. Examination in the University of Virginia Hospital revealed a large tumor easily palpable by digital examination.

A second instance of inadequate examination by the local physician was that of a 16 year old white boy who complained of anal tenesmus, blood and mucus in the stools and pain on defecation for twelve months. He had been under the care of his local physician for the seven months prior to the time of examination in this hospital, and a digital examination had never been performed. Examination revealed a large tumor mass just inside the anal orifice, which on biopsy proved to be grade 3 adenocarcinoma.

A third patient, a 43 year old white woman, complained of rectal bleeding with constipation, rectal urgency and hemorrhoids for ten months. Her physician treated her hemorrhoids with suppositories and referred her to a surgeon six months prior to examination in this hospital. The surgeon performed a hysterectomy and failed to diagnose the carcinoma of the rectum. The growth in this instance also was easily palpable by rectum.

There are other factors directly attributable to the patient which limit the number of cures of carcinoma of the rectum. Of the 17 inoperable patients in this series each of whom had been adequately examined by the local physician at the first visit, it is probable that had the patient consulted his physician at an earlier date a more favorable prognosis might have resulted. The negligence on the part of the patient in consulting a physician when symptoms first appear is perhaps due to two factors. First, some patients are too embarrassed to seek advice and examination and, secondly, the symptoms often cause little discomfort and do not incapacitate the patient enough to impress him with the seriousness of his condition. Bergen and Leddy<sup>9</sup> studied 200 consecutive patients with rectal carcinoma seen at the Mayo Clinic and found that only 46 per cent had consulted physicians within one month after the first appearance of symptoms. The remaining 54 per cent did not consult physicians until two to twenty-four months after the onset of symptoms.

The third cause of an unfavorable prognosis in rectal carcinoma which is also attributable to the patient is refusal of treatment once the diagnosis has been established. In this series 5 patients who were thought clinically to be operable and 12 others in whom operability was equivocal refused surgical exploration, a total of 17 per cent. Jones<sup>4</sup> estimated that 10 per cent of his patients refused treatment.

One other point of importance that should be stressed is the high incidence of rectal carcinoma in younger people. Four patients in this series were under 30 years of age and 1 was only 16. Other writers<sup>10</sup> have stressed the importance of thorough rectal investigation in young persons with rectal complaints.

## SUMMARY

- 1 The greatest responsibility for early diagnosis and treatment of rectal carcinoma falls on the general practitioner.
- 2 Any patient of any age who presents himself with a history of change in bowel habits and/or blood or mucus in the stools should have a thorough rectal examination, including proctoscopic investigation, at the earliest opportunity.
- 3 The treatment of recurrent or prolonged diarrhea without rectal examination is to be condemned.
- 4 The treatment of hemorrhoids by surgical or conservative measures without first an investigation of the upper part of the rectum is also condemned.

## THE THERAPEUTIC EFFICIENCY OF DIETHYLSTILBESTROL ESTERS

S C FREED, MD

W M EISIN, MD

AND

J P GREENHILL, MD

CHICAGO

The comparison of the activity of various estrogens for therapeutic standardization has until recent years depended for the most part on results obtained with laboratory animals. It has been frequently pointed out, however, that assays of estrogens vary extremely in the hands of investigators using different species of animals as well as various strains of the same animal. It is obvious that such a basis for the comparison of estrogens leads to confusion, and a number of investigators have recently suggested that estrogens be assayed directly in studies on man. In this regard changes in the endometrium or vaginal smear of menopausal women have been used for determining the potency of several estrogens.<sup>1</sup> We have pointed out that the use of the endometrial biopsies for assaying purposes is awkward and not sufficiently accurate, since a significant percentage of women in the menopause have varying degrees of endometrial development even without having received estrogen therapy and that specimens of the same endometrium differ when taken from different sites in the uterus.<sup>2</sup> The vaginal smear technic in the human being appears to be reliable<sup>3</sup> but here again

untreated menopausal women have varying degrees of cornification and care must be exercised in selecting only those with sufficiently atrophic vaginal mucosae. There is also a need for data on the quantitative response of the vaginal mucosa to known amounts of estrogens for use as a basis in assaying estrogens. We<sup>4</sup> have proposed a method for determining the potency of estrogens by using the subjective response of menopausal women. In this method nonspecific factors have been to a considerable extent reduced through proper selection of patients, elimination of certain psychic factors and the use of multiple dosage levels. Only patients with moderate or severe symptoms including at least two to four hot flashes daily are used for testing. In treating these patients no suggestion or promise of relief is made, and the patients are not informed of the nature of the medication they are receiving. The relief of all patients is evaluated by one of us in order to make for uniform results. We change the dosage levels without informing the patient. With this technique we have determined the minimal effective dosages of diethylstilbestrol, hexoestrol, octotollin and estrone sulfate,<sup>5</sup> all of them being administered orally. For estrogens that are administered by injection we have adopted a technique whereby the length of the period of relief following the last of a series of injections is an index of the therapeutic efficiency of the estrogens.<sup>6</sup> This method has been used in the present study in testing the efficiency in the human beings of diethylstilbestrol esters.

It is well known that esterification of estrogens improves their efficiency owing to the fact that such a modification delays the absorption of the estrogen from the site of injection, thereby preventing excessive destruction by the body as well as allowing for an even and prolonged effect. The fatty acids chosen for esterification of estrogens as well as other hormones such as testosterone, estradiol and desoxycorticosterone have, however, depended on data obtained in the laboratory animal. In such animals it has been shown that the various esters, though having prolonged effects, are less active in regard to minimal effective doses than the free compound. A compromise was therefore made in selecting those esters which have a relatively slight decrease in activity together with a relatively long period of effect. In regard to diethylstilbestrol, the dipropionate was chosen because it possesses these properties. The higher fatty acid esters were ignored because of their apparent great loss in activity. Thus, while the minimal effective dose of the dipropionate is three to five times greater than that of diethylstilbestrol, the dipalmitate is fifty times greater. Theoretically, therefore, this compound would be far inferior to the dipropionate. In order to determine whether this relationship holds for the human being, the three substances diethylstilbestrol, diethylstilbestrol dipropionate and diethylstilbestrol dipalmitate<sup>8</sup> were compared, the prolongation of relief from menopausal symptoms being used as the criterion of efficiency.

## METHODS AND RESULTS

These three compounds were injected into menopausal patients with moderate or severe symptoms once a week for three weeks. Five mg of diethylstilbestrol was administered at each injection. The amount of the esters injected was calculated to contain an equivalent of 5 mg of the active component diethylstilbestrol. After the third injection the patients were observed at intervals of two to three weeks and placebo injections were administered in order to eliminate as much as possible the psychic factor of injection. At each visit the patient's relief was evaluated according to the disappearance of hot flashes and other peripheral vascular effects and other well known symptoms of the menopause such as nervousness and irritability.

Table 1 shows the number of weeks following the last injection for which each of the patients was free from symptoms.

All patients except those represented by 0s obtained satisfactory or excellent relief of symptoms. From this

TABLE 2—Incidence of Nausea (With and Without Other Symptoms Such as Vomiting, Headache and Dizziness)

|                                 | Total Number of Patients | Patients With Nausea |
|---------------------------------|--------------------------|----------------------|
| Diethylstilbestrol              | 32                       | 15                   |
| Diethylstilbestrol dipropionate | 41                       | 6                    |
| Diethylstilbestrol dipalmitate  | 43                       | 1                    |

table it is apparent that diethylstilbestrol is inferior to the dipropionate in efficiency, since the period of effective relief is significantly less than that of the ester. Thus, for example, 9 out of 32 patients receiving diethylstilbestrol obtained either no relief or relief for only one week, while only 3 patients out of 41 who received the dipropionate were similarly affected. The dipropionate was effective on an average of five weeks, or about one week longer than was the diethylstilbestrol. Diethylstilbestrol dipalmitate, on the other hand, was far more effective than the dipropionate. Patients obtained relief for an average of nine to ten weeks following the last injection and only 5 of 43 patients had less than five weeks' relief, compared to 18 of 41 with dipropionate and 21 of 32 with diethylstilbestrol.

The incidence of toxicity following administration of diethylstilbestrol compounds is of considerable interest since this offers one of the greatest disadvantages to their use. Table 2 shows the incidence of toxicity following the administration of these three compounds, the development of nausea being used to indicate toxicity.

It can be seen from this table that the dipropionate is considerably less toxic than the free compound con-

<sup>8</sup> These three substances were supplied by Abbott Laboratories. The diethylstilbestrol dipalmitate has a melting point of 77.78 F.

firming the results of others in this respect.<sup>9</sup> Dipalmitate is practically free from toxicity, since only 1 patient out of 43 complained of nausea.

## COMMENT

Our results demonstrate once again the limitations of using laboratory assays as a basis for therapeutic standardization. We have shown that the compound diethylstilbestrol dipalmitate, which in the rat requires an amount fifty times greater than diethylstilbestrol to produce an effective response, is far more potent in the human being. Similarly it is significantly more efficient than the dipropionate, which was selected for therapeutic use as the most efficient fatty acid ester on the basis of laboratory data. It is most likely that the relationship of efficiency of these three compounds is reversed in the human being from that of the rat as a result of different rates of absorption and utilization of the compounds. It is indeed interesting that diethylstilbestrol dibenzoate,<sup>10</sup> which is comparable to the dipalmitate in the rat in regard to the minimal effective dose and the prolongation of effect, approximates in the human being the action of the dipropionate. Selection of the appropriate esters or other modifications of estrogens should, therefore, be determined only by direct assays in the human subject and not by clinical application of data derived from experimental animals. It is quite possible that fatty acids of higher types other than palmitic acid would be even more efficient. The latter was selected only because the wide divergence of minimal effective dosages offered an opportunity to demonstrate striking results.

The low incidence of toxicity of the diethylstilbestrol esters and especially the dipalmitate is highly gratifying, since the chief disadvantage to the use of diethylstilbestrol has been the relatively frequent side reactions. The reduction in incidence in toxicity appears to be in direct proportion to the decrease in rate of absorption of the fatty acid compounds. This substantiates our previous postulation<sup>11</sup> that the disagreeable symptoms following administration of diethylstilbestrol resulted from its rapid introduction into the blood stream, a condition found also in early pregnancy, in which condition similar symptoms are present.

In our hands diethylstilbestrol dipalmitate appears to be an ideal estrogen. It is highly effective, its action is prolonged over a long period and it gives rise to little or no unpleasant reaction. It is entirely possible that similar high fatty acid esters of other compounds such as testosterone, desoxycorticosterone and estradiol may show a similar increase in efficiency when tested in the human being.

## SUMMARY

Diethylstilbestrol, diethylstilbestrol dipropionate and diethylstilbestrol dipalmitate have been assayed for their therapeutic efficiency in the human being, the subjective response of menopausal patients being used as the criterion of efficiency. Diethylstilbestrol dipalmitate is superior to the others in having a considerably prolonged period of effect together with little or no toxicity. Our results demonstrate once again the limitations of using laboratory animals for therapeutic standardization and the necessity of testing such compounds directly in the human being.

## Clinical Notes, Suggestions and New Instruments

### A VENOCLYSIS UNIT RESISTANT TO FREEZING

A. C. IVY, PH.D., M.D., AND S. C. HARRIS, M.S., CHICAGO

Fluids for venoclysis are now dispensed in glassware, which will fracture when handled roughly or when the contents are frozen. It was deemed advisable, for reasons unnecessary to record here, to have a venoclysis unit devoid of these objections.

Distilled water and various solutions for intravenous use may be packed in properly fabricated enamel lined tin cans. However, the solutions are not readily evacuated from the cans without risk of contamination, and the duration of the reliability of solutions so packed is relatively short because corrosion cannot be prevented to an extent that renders the method free from danger.

To obviate these difficulties, it was necessary to find a unit which was resistant to corrosion and which could be placed in a can. Various types of rubber bags and plastics were first

1 the can in which the venoclysis unit (B) is packed shows the heads for rigidity against freezing and the keg opening device. 1, the hook for hanging the unit. 2, aluminum alloy cap, fitting snugly against the rubber washer (4), which seals the Visking bag, which is turned back over the aluminum ring (3), which in turn clamps the Visking bag against the solid aluminum alloy base (5). The dispensing end of the unit is closed like the end for hanging. The nut (7) holds the aluminum alloy cap against the rubber washer (4) at the end for hanging. The cap adapter (8) is machined to take a hypodermic needle, and (9) is the cap sealing the opening and protecting the adapter. In the top of the cap (9) a specially prepared cork washer is placed to secure the seal.

employed, but when the package, packed under vacuum, was sterilized the solutions became contaminated, as evidenced by the odor and taste and by the presence of pyrogenic substances. After much experimentation it was found that a Visking sausage casing (Visking Corporation, Chicago) was a suitable container for fluids intended for venoclysis. For closing the ends of the casing, various plastics were found to be unsuitable because they became deformed on heating or freezing and imparted objectionable qualities to the solution. Further experimentation showed that an aluminum alloy (Aluminum Company of America) electroplated with aluminum oxide was sufficiently inert chemically to be used for closing the ends of the casing.

After the various parts of the unit shown in the illustration are cleaned and properly prepared, 600 cc of triple distilled

<sup>9</sup> Greene, R. R., and Dorr, E. M. Relation of Dose and Type of Estrogen to Nausea and Vomiting, *J. Clin. Endocrinol.* 1: 821 (Oct) 1941.

<sup>10</sup> Freed, S. C., Eism, W. M., and Greenhill, J. P. Unpublished work.

<sup>11</sup> Freed, S. C. Recent Progress in Estrogen Therapy, *Illinois M. J.* 80: 139 (Aug) 1941.

water or solution is placed in the unit the outside of the unit is rinsed and the unit is placed in the can, which is closed under vacuum and autoclaved. The packed can (American Can Company) may then be subjected to freezing (—55 F overnight), to an altitude of 45,000 feet and to one to two atmospheres of pressure without rupture of the contents or injury of the contained unit. The only disadvantageous feature of the pack is that because of the permeability of the Viking bag, from 20 to 40 cc of the solution passes out into the can when exposed to the vacuum packing procedure. The unit should be wiped with a towel when lifted from the opened can.

One end of the unit is provided with an adapter (covered by the cap in the illustration) to take a 1/16 inch hypodermic needle or a rubber tube. The other end is provided with a hook for suspension. The unit does not require a breather, since it collapses with gravity or can be squeezed with the hand to speed the flow of solution. In fact a small can containing a rubber or Viking tube of small bore, a hypodermic needle with adhesive tape and anti-rupture gauze could be placed in a small tin container. This in turn could be soldered to the larger can thus providing a complete emergency kit for the intravenous administration of fluid or supplying distilled water for the solution of a package of dried plasma or serum.

Such units have been packed with distilled water 0.9 per cent sodium chloride solution, Locke's solution 5 per cent dextrose solution and 0 per cent serum in 0.9 per cent sodium chloride solution. At various times up to six months after packing, 100 cc quantities of such solutions have been given intravenously during twenty to thirty minutes to dogs trained to lie quietly without any elevation of rectal temperature over a period of five hours. The solutions by bacteriologic test have been sterile. Traces of iron and aluminum have been found in the solutions only after six months. In several instances the can had corroded in small areas and stained the bag. This may be avoided by giving the cans an extra coat of enamel after the beads in the wall of the cans have been formed. (The beads are necessary to give the can strength to withstand freezing.)

Through the courtesy of Dr. C. M. Davison and F. J. Leeman Jr. of Cook County Hospital, 14 nontyphoid patients have received 500 cc of 0.9 per cent sodium chloride solution intravenously from units packed and kept in an incubator (38 C.) for one month. No subjective symptoms were reported by the patients, and the rectal temperature recorded hourly for five hours showed no change greater than that normally observed.

#### SUMMARY

A venoclysis unit resistant to freezing and rough handling has been constructed. Various solutions used clinically have been packed in the unit and found to be suitable for intravenous use as evaluated on human subjects and on dogs. Solutions so prepared and stored appear to be stable and unaltered for at least six months; however observations on man have not been extended beyond one month.

#### TYPHUS FEVER IN A PREVIOUSLY VACCINATED LABORATORY WORKER

HERMAN GOLD, M.D. AND FLORENCE FITZPATRICK  
GLENOLDEN, PA.

**History of Present Illness.**—Dr. B. H., a white woman aged 43, was well until Feb. 7, 1942, when malaise, slight headache and fever developed. At 7 p. m. her temperature was 99 F. The next day the symptoms were unchanged and she reported to work on the 9th, she felt well during the morning but in the afternoon she was unduly fatigued and feverish. There was loss of appetite and considerable sweating. On the 11th severe aching pain developed across the back of the head and lasted throughout the duration of fever. There was no vomiting and the bowel movements were regular. Fever and headache were the outstanding complaints when one of us (H. G.) saw the patient on the 12th at 9 p. m. Her temperature then

was 102.4 F. with a corresponding rise in the pulse and respiration. The skin was dry and hot. The tongue was slightly coated. Careful physical examination failed to disclose any pathologic abnormalities. Catheterized urine was normal and the white blood cell count was 4,200 cells per cubic millimeter. The past medical and family histories were irrelevant.

Because of the occupational history and absent physical manifestations we suspected that this bizarre fever was atypical typhus and advised hospitalization. She was admitted to the Chester Hospital on the 13th. The urine was again found to be normal and the complete blood count was reported as red cells 3,930,000, hemoglobin content 13 Gm., white cells 4,100, polymorphonuclear leukocytes 58 per cent (segmented 18 per cent band 37 per cent), metamyelocytes 2 per cent, myelocytes 1 per cent, lymphocytes 42 per cent. Severe headache persisted until the 15th when it decreased in intensity and then disappeared in thirty-six hours. The headache came in paroxysms accompanying the bouts of fever. During febrile remissions the patient had no complaints except that she felt weak and tired. Profuse sweating occurred at night. On the 14th two to three small pale pink macules were noted on the upper part of the abdomen. They disappeared under pressure and lasted only a few hours. The spleen and liver

Temperature, pulse and respiratory rate

were not palpable. The temperature became normal on the 17th and the patient began to have a good appetite. On the 16th the blood count was reported as red cells 3,450,000, hemoglobin content 12 Gm., white cells 7,900, polymorphonuclear leukocytes 65 per cent, eosinophils 1 per cent, monocytes 4 per cent, lymphocytes 29 per cent, basophils 1 per cent. She was discharged from the hospital on the 19th and returned to work six days later. There were no sequelae. Her temperature record is shown.

**Occupational History.**—Eggs previously inoculated with typhus virus (Bremi strain) had been harvested by the patient with the assistance of a technician. Sterile gowns, goggles, face masks and rubber gloves were worn throughout the procedure. The patient cracked the eggs over a sterile pan and removed the yolk sacs with sterile forceps. After collection of the yolk sacs, grinding was done in a Waring Blendor. The container of the mixer was covered with phenolized gauze and a metal top. Because of the possible occurrence of air borne infection from a fine spray, the material was allowed to settle after being ground before the metal top was removed. The material was then poured into a bottle under phenol gauze and diluted and solution of formaldehyde was added.

The patient came in contact with the virus for the first time on Jan. 20, 1942 when she harvested forty-one eggs (length of exposure thirty minutes). On January 26 she harvested fifty-six eggs (forty minutes). On February 3 she handled

one hundred and twenty-one eggs (two hours) and on February 9 she harvested one hundred and thirty-two eggs (two hours). There was no history of injury or accidental exposure to the virus.

**Immunologic History**—In anticipation of her assignment to the typhus vaccine division the patient was actively immunized against typhus by means of three weekly injections (1 cc each) of Cox yolk sac vaccine supplied by the National Institute of Health. After a control bleeding had been obtained the first dose was given on Nov. 7, 1941. A follow-up sample of blood was obtained on December 1, ten days after the third dose of vaccine had been injected (shown in the accompanying table). On the day the patient began to harvest inoculated eggs (Jan. 20, 1942) she received her fourth dose (1 cc) of the National Institute of Health vaccine. Her present illness began eighteen days after this repeat injection. Blood obtained on February 11 and 12, on the fifth and sixth days of illness, was injected intraperitoneally into guinea pigs. Of 5 animals thus inoculated only 1 (inoculated with the specimen of February 11) had an elevation of temperature beginning the sixteenth day. From this guinea pig a strain of European typhus was isolated and maintained in serial passage.

The results of agglutination<sup>1</sup> and complement fixation tests performed before, during and after the illness are shown in the table.

technician's blood serum showed rickettsial agglutinin titer of + in a 1:80 dilution.

This factor of poor response to vaccination and the possible occurrence of atypical (modified) typhus infection in such vaccinated persons raise important public health problems, especially under war conditions. From the clinical course in our case, which in the first few days could have been incorrectly diagnosed as grip or influenza, it is clear that the occurrence of unexplained fever among troops vaccinated against typhus and who are operating in known endemic areas must be suspected as possibly due to typhus until proved otherwise. As demonstrated in our patient, the virus can be recovered from the blood of vaccinated persons early in the disease. This would call for the prompt isolation of all persons with suspected typhus fever to prevent them from becoming the center of epidemics of the classic form of the disease among the nonvaccinated population.

ADDENDUM

Since the foregoing report was submitted for publication, we have successfully treated a second case of laboratory typhus infection in a vaccinated technician. The patient, a woman aged 25, had been working for three months in the typhus vaccine division of Sharp and Dohme when on May 9, 1942 she accidentally splashed the contents of a syringe (about 5 cc

Agglutination Tests

COMMENT

The isolation of the European strain of typhus virus from the patient's blood on the fifth day of illness proves beyond doubt that we were dealing with a case of atypical (modified) typhus fever. Further corroborative evidence is to be found in the rise of the agglutinin titer to both *Proteus vulgaris* O X 19 and typhus rickettsiae displayed by the patient during convalescence.

Infection apparently occurred by way of the respiratory tract, following what appears to have been a light exposure to the virus, in spite of the use of extraordinary protective measures and previous immunization with the National Institute of Health vaccine. Four cc of this vaccine given within seven weeks failed to give the patient complete protection against typhus. On the other hand, partial protection apparently resulted therefrom, as evidenced by the mild type of typhus fever (without rash) that ensued. It may be argued that the mildness of the infection was rather the result of a light exposure. Against this hypothesis we may recite the fact that the technician who assisted our patient and who underwent a similar degree of exposure to the virus did not contract the disease. This may be accounted for by the difference in their immunologic response to vaccination against typhus fever. Our patient's response was poor, while in the case of the technician, who had been similarly vaccinated before exposure, it was good. Ten days after the third dose of vaccine, the

of a suspension of European typhus virus) on her face and right eye. Four days later she came down with fever, and the clinical picture that developed thereafter was similar to that of our first case. Photophobia, muscular aching, hyperesthesia to deep pressure and mental depression were prominent features. On the fourth day of fever, four pale pink macules were noted on the epigastrium. They disappeared in twenty-four hours. The febrile period lasted four days (100-102 F) and the patient made a complete recovery in a week. We failed to recover the virus, perhaps because the specimens of blood studied were obtained too early (on the first and second days of fever) but the diagnosis was confirmed by the steep rise in the agglutinin titers to *Proteus vulgaris* O X 19 and European rickettsiae that occurred after the eighth day of illness (rickettsial agglutinin + in 1:280 dilution).

Previous to the onset of typhus fever, the patient had received three weekly 1 cc injections of the N I H vaccine (last dose, Feb. 4, 1942) followed by two injections of 0.5 cc and 1.0 cc respectively (Feb. 12 and 24) of an egg yolk typhus vaccine prepared by the Sharp and Dohme laboratories, which was richer in rickettsiae than the N I H antigen. Following vaccination there was no change in the Weil-Felix reaction, but the rickettsial agglutinin titer rose from 0 to + in 1:40 dilution on the ninth day after the third dose of vaccine and to + in 1:80 dilution five weeks after the fifth dose of vaccine. Similarly the complement fixation became positive in 1:4 and 1:8 dilutions on these two dates. Yet this patient developed modified typhus fever following the accidental exposure that occurred about eleven weeks after the fifth dose of vaccine had been injected. This corroborates the conclusions deduced from the first case.

## PLACENTA ACCRETA

REX J. SAIT, M.D. AND C. W. SEIBERT, M.D.  
WATERLOO, IOWA

Placenta accreta is a serious but fortunately a rare complication of labor. Meyer and Ashworth<sup>1</sup> found 118 authentic cases after careful search of the literature up to 1910. The reported incidence of this condition differs greatly, varying from 1 in 5,000 to 1 in 50,000 deliveries. As a rough estimate, it probably occurs about once in every 10,000 deliveries.

The chief pathologic change in placenta accreta is a complete or partial absence of the decidua basalis which allows the villi to burrow directly into the uterine musculature and prevents separation of the placenta after delivery.

Any condition producing primary atrophy of the endometrium may be a predisposing factor. Conditions which have been implicated include previous manual removal of the placenta, too thorough curettage, submucous fibromyomas, endometritis and possibly dys-hormonism since hormones play an important role in the formation of the decidua.

The chief symptom of this condition is brisk bleeding when an attempt is made to deliver the placenta. This usually continues until manual removal of the placenta is attempted and the operator finds it firmly adherent to the uterus, there being no line of cleavage. Persistent attempts at manual removal result in increasing the bleeding or in perforation of the uterus.

All authorities agree that immediate hysterectomy is the treatment of choice. Mortality from conservative attempts at removal is five or six times that of cases treated radically.

The case to be described was considered worth recording because the situation was such at the time when the diagnosis was made that laparotomy was absolutely contraindicated not only by the severe shock but by the evidence of sepsis, and conservative management was the only alternative. Anderson<sup>2</sup> has reported a case which was treated very similarly.

## REPORT OF CASE

Mrs. F. M., aged 26, was a white primigravida with negative past medical record with the exception of an appendectomy in 1927. Physical examination was negative. Pelvic measurements were within normal limits, and the blood Wassermann reaction was negative. The antepartum course was entirely uneventful.

On Jan. 11, 1941 she was admitted to St. Francis Hospital in active labor. Five hours later a normal female child was delivered by low forceps. There was no bleeding for forty-five minutes following delivery, the uterus being very firm. After repair of the episiotomy an unsuccessful attempt was made to express the placenta by the Crede method. The patient was anesthetized again with nitrous oxide and oxygen and an attempt made to remove the placenta manually. This maneuver was difficult because of the firm contraction of the uterus. The placenta could be outlined, but separation could not be accomplished without danger of rupturing the uterus. There was no line of cleavage, and the organ seemed to be an integral part of the uterine wall.

The patient was returned to her room in mild shock. 1,000 cc. of isotonic solution of sodium chloride was administered intravenously. Twelve hours after delivery, persistent but not profuse vaginal bleeding developed and the patient complained of severe abdominal cramp-like pain, which was only partially relieved by morphine.

Because of persistent vaginal bleeding and slow but steady elevation of the pulse rate, manual removal of the placenta was attempted again twenty-four hours after the first attempt but was again unsuccessful. A presumptive diagnosis of placenta accreta was then made, but because of the poor condition of the patient, hysterectomy was considered unwise. A transfusion of 600 cc. of citrated blood was given at this time.

The patient's condition became progressively worse, and on the third postpartum day she developed severe abdominal distention with evidence of sepsis: temperature 105 F., pulse rate 150, erythrocytes 2,400,000 and leukocytes 16,000, the differ-

ential count showing 5 per cent juvenile, 52 per cent stab and 29 per cent segmented neutrophils. Wangenstein duodenal suction was used to relieve the distention. The vaginal discharge became very profuse and foul smelling. A transfusion of 500 cc. of citrated blood was given every other day from the third to the eleventh postpartum day. On the alternate days 4 Gm. of sodium salicylpyridine was administered intravenously in 1,000 cc. of isotonic solution of sodium chloride every eight hours. Owing to lack of laboratory equipment, blood salicylpyridine levels were not determined. Five cc. of azosulamide solution was injected every four hours for two days, and then 2 cc. every four hours intramuscularly.

The temperature began to subside on the ninth postpartum day and remained normal after the fourteenth day. The patient was discharged from the hospital on the nineteenth postpartum day and remained in bed at home until the thirty-second postpartum day when he had regained enough strength to begin walking. Improvement from that time was rapid. There was no vaginal discharge and the uterus had decreased definitely in size. Three months following delivery she had a normal menstruation and has had no menstrual difficulty since. Pelvic examination has shown the uterus to be normal in size and shape, anterior and freely movable. Apparently recovery has been complete.

## COMMENT

The case reported by Anderson<sup>2</sup> differs from this in that hysterectomy was done later and the diagnosis of placenta accreta was verified microscopically. In our patient, improvement continued under conservative management to the point where there was no indication for surgical attack when her general condition would have justified such intervention. Evidently the placenta sloughed out in the profuse, foul discharge, although no portion of it was ever identified. The resumption of normal menstruation after three months supports this assumption.

The present report constitutes no good argument for the conservative treatment of placenta accreta, which should normally be treated by hysterectomy, but does indicate that the condition of a patient with this abnormality is not necessarily hopeless, even when laparotomy is contraindicated.

## A NOTE ON PALMAR ERYTHEMA (SO CALLED LIVER PALMS)

GEORGE A. PERERA, M.D., NEW YORK

A palmar erythema has been occasionally noted by clinicians or mentioned because of its association with Laënnec's cirrhosis<sup>1</sup> but has never been adequately described. This not uncommon lesion consists of a symmetrical, erythematous, capillary and arteriolar dilatation involving the eminences of the palms and the digits of the hands, rarely the soles, at times extending over the fingertips to the nailbeds and lateral distal phalanges. It may exist in all gradations from a diffuse or blotchy redness to multiple small telangiectatic areas but is characteristically well demarcated and limited to the sites mentioned. In its milder stages the palmar eminences may be involved without digital erythema.

A review of 30 patients who presented this disorder revealed that it was encountered most frequently in cirrhosis (5 of 20 consecutive patients admitted with this diagnosis had palmar erythema) but also in chronic diseases of the alimentary tract such as ulcer, colitis or neoplasm, rheumatoid arthritis and in chronic febrile illnesses, i.e. leukemia, chronic suppuration and subacute bacterial endocarditis. In addition it was occasionally noted in thyrotoxicosis and rheumatic heart disease and in senile and debilitated patients and was found rarely in apparently normal individuals.

In an attempt to correlate this lesion with the history, physical examination and laboratory findings, it was observed that by far the majority of the patients had been ill for many months, and 21 gave a definite history of prolonged dietary insufficiency. Eleven of the group showed associated signs of a deficiency

state such as a smooth, red tongue, peripheral neuritis or cheilosis. Although anemia was common, it was not a necessary concomitant. In 14 cases in which data were available, no consistent relationship to reduced or altered serum proteins or deranged liver function was suggested. Three weeks of intensive therapy with thiamine hydrochloride, nicotinic acid, riboflavin or brewers' yeast caused no observable change, yet 2 patients with Liemann's cirrhosis, who responded favorably to a high carbohydrate and high vitamin regimen, showed disappearance of palmar erythema after about a four months period had elapsed.

Examination of the lesions demonstrated blanching on pressure, with more rapid return of color than is true in the normal hand. Fading of the erythema did not take place with elevation of the hand, and definite flushing synchronous with the arterial pulse was seen when the color was partially obliterated by pressure with a glass slide. With the inconstant exception of patients with rheumatoid arthritis, whose moist palms felt cooler as the result perhaps of increased vaporization, hands with palmar erythema were often unusually warm to the touch.

In 5 cases no change in appearance could be noted when a blood pressure cuff was placed on the arm between systolic and diastolic levels, and only slight fading took place when pressures above systolic readings were introduced with the arms elevated vertically. If the erythema was reduced by massaging the involved areas while the cuff was inflated, full color reappeared as the pressure was lowered to 40-50 mm. of mercury. In addition to this suggestive evidence of increased arteriolar flow, capillaries were found to be more numerous and dilated on direct microscopic examination. Immersion of the hands for three minutes in water at 3 or at 37 C had no effect.

Epinephrine (0.5 cc. of 1:1000 solution), given hypodermically to 3 patients, produced slight fading in color, and 0.3 cc. injected into the brachial artery caused prompt and profound blanching of the hand on the side of the injection and minimal alteration on the opposite side. Atropine subcutaneously or by vein resulted in no change, nor was the erythema affected by ulnar nerve procaine block or electrical stimulation of the same nerve in these 3 cases.

Pathologic examination of the lesions of 2 patients who died of cirrhosis showed no microscopic vascular or other abnormalities in skin or subcutaneous tissues.

#### SUMMARY

A palmar erythema, a peripheral vascular dilatation involving chiefly the eminences of the palms and digits, has been observed. Although its cause remains obscure, it is usually associated with chronic disease and prolonged dietary insufficiency or deficiency states.

#### THE TREATMENT OF DELIRIUM TREMENS

E. A. CANNON, M.D., W. H. MODARELLI, M.D.,  
F. R. DeVINCENZO, M.D., and M. SWINEY, III, M.D.,  
HOBOKEN, N. J.

The problem of the treatment and care of patients with delirium tremens is well known. Usually large quantities of sedatives, drastic purgatives and frequent spinal taps are used. The patient remains strapped in bed, straining against his bonds and raising considerable disturbance. The difficulty of treating associated conditions such as lobar pneumonia, perforations of the bowel or fractures of all kinds are greatly prevented by the actions of the patient in delirium.

Many such problems occurred at St. Mary's Hospital. We would like to present our comparatively simple treatment used on a number of patients in recent months. We employ an intravenous injection of 50 cc. of 50 per cent dextrose, 8 cc. of vitamin B<sub>1</sub> (approximately 25,000 units) and 25 units of insulin, all in one injection, as soon as the diagnosis is made. Sedation of any kind is not given. The straps are kept in readiness but have not been used. In the course of two hours, the patients become quiet and calm and for the first

time say they feel well. Usually one injection is sufficient, but in the case of chronic alcoholism an injection of the same dose or half the dose, depending on the condition, is sometimes necessary the next day. The patients are started on a light diet of Sippy character and vitamin B complex 2 tablets three times a day. Soon they eat well and are subjectively and objectively improved.

Because St. Mary's Hospital is essentially a busy city hospital, blood chemistry studies were not carried out routinely. Treatment was instituted as soon as a diagnosis was made. Delirium tremens is considered by many to be the result of a cerebral edema with involvement of the cerebral, spinal and peripheral nerves. Many of the patients with delirium tremens have not eaten regularly for days, weeks and even months and consequently have a disturbed metabolism of fat, carbohydrates and proteins. The dextrose decreases the cerebral edema temporarily; the insulin stimulates the appetite and allows the sugar to burn in the presence of vitamin B<sub>1</sub>, preventing a return of the edema; the oxidation of fat is reinitiated. Vitamin B<sub>1</sub> is a generally accepted treatment for conditions of this type involving the central nervous system and incidentally increases the desire for food.

This treatment has been used on 15 patients with complicated and uncomplicated delirium tremens with success. In 1 case a hypoglycemic reaction was promptly controlled with 6 ounces (180 cc.) of orange juice and 1 teaspoon of sugar. The treatment was used in cases complicated with pneumonia with equally good results; it was also used with benefit and uneventful recovery in 1 case of alcoholism complicated with perforated peptic ulcer in which delirium tremens developed postoperatively.

Further investigation in the field of chemical determinations of the blood may help to decide the exact roles played by the vitamin B<sub>1</sub>, insulin and dextrose.

### Special Article

#### HANDBOOK OF NUTRITION V

#### WATER AND SALT REQUIREMENTS IN HEALTH AND DISEASE

JOHN H. TALBOTT, M.D.

BOSTON

*These special articles on foods and nutrition have been prepared under the auspices of the Council on Foods and Nutrition. The opinions expressed are those of the authors and do not necessarily reflect the opinion of the Council. These articles will be published later as a Handbook of Nutrition.—Ed.*

Salts and water of the body are inextricably bound in their interchange between organism and environment. This generalization applies particularly to sodium, potassium, chloride, bicarbonate, phosphate and protein, electrolytes which are the principal contributors to the pattern of intracellular and extracellular fluid. The exchange of these electrolytes and the exchange of water comprise the theme of this chapter. Several other electrolytes present in the human organism such as magnesium, calcium, lactate, iron, iodide and urate are osmotically unimportant for fluid balance and will not be discussed. The anatomy of body fluids, i.e. the structural compartments and the concentration of electrolytes, will be outlined first. It will be followed by an inquiry into the mechanism of the ingress of the several components into the body. The remainder of the review, which is proportionately longest, will be concerned with their egress from the body.

It is deemed most appropriate in the introduction to give credit to the masters in the field, Dill, Gamble,

From the St. Mary's Hospital, Dr. Joseph F. Londrign, Medical Director.

Dr. Cannon is the attending physician, Drs. Modarelli and DeVincenzo are assistant attending physicians and Dr. Swiney is the medical intern.

From the Medical Clinic, Massachusetts General Hospital and the Fatigue Laboratory, Harvard University.

Hampers Henderson Peters Smith and Van Slyke and others who by their researches physiologic and clinical, have contributed in large measure to our present knowledge of body fluids. Several of their contributions have been freely drawn on in the preparation of this article.<sup>1</sup>

### THE ANATOMY OF BODY FLUIDS

The fluid structures of the body as we know them are divided into three parts: blood, interstitial fluid (including lymph) and intracellular fluid. The volume of interstitial fluid is the most labile of the three and expands or contracts with the changing physiologic needs of the body such as occur during digestion, sleep or profuse sweating. In morbid disturbances of fluid balance this compartment likewise is the buffer between the other two and may undergo profound alteration that is not reflected in the volume of blood or volume of intracellular fluid. The resistance of these two compartments to change at the expense of interstitial fluid is an example of the rigorous and effective equilibrium exercised by the body in its homeostasis. The concentration of electrolytes occupies an intermediary position with regard to capacity to change under varying stresses. The concentration of electrolytes is maintained within a narrow range in health in each of the three major compartments of body fluids. In sickness the concentrations of plasma and interstitial fluid electrolytes yield before the integrity of intracellular fluid is threatened.

The amount of fluid in the body is approximately 70 per cent of the total mass. This is distributed as follows: The volume of circulating blood plasma is approximately 5 per cent of the total body weight or 3.5 liters in a person of 70 Kg (154 pounds). Interstitial fluid comprises 15 per cent of body weight or 10.5 liters. Intracellular fluid comprises 50 per cent of body weight, or 35 liters in a person of 70 Kg.

The values quoted have been derived from experimental procedures, direct and indirect. Plasma volume may be determined in the intact animal or in man by noting the dilution of an intravenously injected nontoxic dye by a method similar to that described by Gregerson, Gibson and Stead.<sup>2</sup> Only small amounts of plasma are needed for the determination if the readings are made in a photocolormeter.<sup>3</sup> Whole blood volume is calculated directly from plasma volume by taking into account the hematocrit reading. Interstitial fluid volume may be determined simultaneously if a few decigrams of sodium thiocyanate<sup>4</sup> is injected with the dye. No satisfactory method has been devised for determining volume of intracellular fluid or of total body water in human beings. This is a serious void in the armamentarium of

the clinical investigator. The values given for these components have been deduced from sacrifice experiments on animals.

The concentration of electrolytes in the fluid compartments of the body except blood is less amenable to experimental determination than are the volumes. Whole blood and plasma are the only phases that may be approached directly. The concentrations in interstitial fluid however are similar to their concentrations in a protein free filtrate of plasma. This is fortuitous and its information is available concerning plasma, deductions concerning interstitial fluid are probably valid. The concentration of electrolytes in arterial plasma of a normal person is given in the accompanying table.

The concentrations in venous plasma, except for bicarbonate are essentially the same as for arterial plasma. Inspection of the data shows that the sum of the acids equals the sum of the bases. The solution is slightly alkaline the  $p_{H_{15}}$ ,<sup>5</sup> which is an index of the hydrogen ion concentration being 7.40. Within the limits  $p_{H_{15}}$  4 to  $p_{H_{15}}$  10 the contribution of H and OH ions to the foregoing summation would be negligible. The sum of the four bases may be expressed as total

Concentration of Electrolytes in Arterial Plasma

| Bases     |               | Acids        |               |
|-----------|---------------|--------------|---------------|
|           | mEq per Liter |              | mEq per Liter |
| Sodium    | 140           | Chloride     | 104           |
| Potassium | 4             | Bicarbonate  | 26            |
| Calcium   | 5             | Protemate    | 17            |
| Magnesium | 2             | Phosphate    | 2             |
|           |               | Lactate      | 1             |
|           |               | Undetermined | 2             |
| Total     | 151           | Total        | 151           |

fixed base or total inorganic base. There is only a negligible quantity of organic base in the plasma of normal persons. Total fixed base may be determined with a high degree of accuracy by electroanalysis using not more than 0.2 cc of material.<sup>6</sup> If the bases are determined individually, 1 or 2 cc of material is needed for the respective constituents (sodium,<sup>7</sup> potassium,<sup>8</sup> calcium,<sup>9</sup> magnesium<sup>10</sup>). The value for the sum of the individual bases is useful as a check against total fixed base, while both are useful as a check against the sum of the determined acids. No single procedure has been devised for the determination of total acids as has been devised for total base. Organic and inorganic acids are present in health and in disease. The acids may be determined individually on 1 cc or less of plasma.

(chloride,<sup>11</sup> bicarbonate,<sup>12</sup> proteinate,<sup>13</sup> phosphate,<sup>14</sup> lactate<sup>15</sup>) If microprocedures are employed it is possible to collect thoroughly reliable data of the complete acid-base pattern of plasma with not more than a total of 10 cc of material, which may be obtained from 20 cc of whole blood

The nomenclature milliequivalents per liter (mEq/L) used to express concentration of constituents seems formidable to many physicians. It is no more mysterious, however, than milligrams or centimeters to the uninitiated. Its concentrations are expressed in milliequivalents per liter, values for different constituents readily may be compared, as in the statement previously made that the sum of the bases should equal the sum of the acids. Comparison would be impossible if a heterogeneous nomenclature were used and sodium were expressed as milligrams per hundred cubic centimeters, protein as grams per hundred cubic centimeters and bicarbonate as volumes per hundred cubic centimeters.<sup>16</sup>

Sodium and chloride comprise the bulk of the electrolytes in plasma and interstitial fluid. The presence of potassium in plasma is little more than evidence of its migration to and from intracellular spaces. Protein is essential for maintenance of osmotic pressure in the blood. It is expressed as the acid proteinate in the table. Bicarbonate and phosphate participate in two functions. Both are waste products of metabolism but in the process of elimination contribute to the regulation of the acid-base equilibrium of the body.

#### THE INGRESS OF WATER AND SALT INTO THE BODY

Water gains entrance into the body in health by way of the upper gastrointestinal tract. It may be ingested as a liquid or as the fluid content of foodstuffs. A small quantity of water in addition is formed within the body daily during the metabolism of foodstuffs. The fluid requirements of persons who live a sedentary life are satisfied ordinarily by the habitual intake of fluid with and between meals. Most persons do not wait until they are thirsty to take liquids but have learned by habit that periodic ingestion keeps them from becoming thirsty. Following inadequate intake of fluid or increased loss from the body, such as is produced by sweating during strenuous exercise, the sensation of thirst appears.

The pathogenesis of thirst has not been decided with finality, but Dill<sup>1</sup> has presented several convincing arguments from the available experimental data. He has concluded that

Thirst does not necessarily depend on a dry mouth. Thirst without a dry mouth is experienced by man at the evening meal after hard work on a hot day. It is experienced by marine

telcosts despite a constantly flowing stream of water through the mouth. Normal dogs without salivary glands do not exhibit unusual thirst.

Thirst does not have a single dependence on osmotic pressure of body fluids. A small increase in osmotic pressure produced by ingestion of sodium chloride produces intense thirst, while if the same increase in osmotic pressure is induced by urea the thirst is only moderate.

Thirst does not depend on volume of blood plasma nor of extracellular phase of other tissues. Intraperitoneal injection of glucose solution reduces the volume of the extracellular phase without causing thirst.

Thirst depends on diminished water content and possibly increased osmotic pressure of body cells. While thirst may be somewhat alleviated by rinsing the mouth, it can be satisfied only when water has been delivered by the blood stream to the tissue cells that are demanding it.

The mechanism by which the demand for water makes itself known remains to be elucidated. Contractions of the smooth muscle of the esophagus may be involved.

Thirst is a sensation that man has associated with lack of fluid in the body and usually is satiated by ingestion of water. Thirst associated with dehydration, however, whether in sickness or in health, is probably an index of salt lack as well as fluid lack. Indeed, if dehydration is profound, ingestion of water without sodium chloride does not satiate. The ability to distinguish between desire for water and desire for salt is believed by students of natural history to be highly developed in animals. Man presumably has lost this fine sense of discrimination. It is possible that during the evolutionary era a trick was played on man, since his need for salt is quite as vital as that of animals.

A detailed presentation of the intake of the salts will not be attempted. Except for certain unusual circumstances the requirements of the body should be satisfied by the salts in the diet. This will be considered at length by Icie G. Macy in another article in this series.<sup>18</sup>

#### EGRESS OF WATER AND SALT FROM THE BODY

Fluid is lost from the body in expired air, sweat, gastrointestinal discharges and urine. The losses through the first three channels total approximately 2 liters daily and are essentially beyond voluntary control. The quantity of water which remains for disposal after these requirements have been satisfied is voided by the kidneys. The kidneys act in this capacity as the buffer organ for excretion of fluid just as interstitial fluid is the buffer compartment for storage of fluid. If an excess of water has been taken into the body, the kidneys are called on to excrete it. If the quantity of body water is less than normal, little or no urine may be voided. The other excretory channels, meanwhile, continue to have their requirements satisfied.

Respiration is a complex mechanism that involves loss of water vapor, gas exchange and regulation of the acid-base equilibrium of the body. The delivery of oxygen to the alveolar spaces and to the circulating hemoglobin in the pulmonary vessels is a vital process. The removal of carbon dioxide occurs simultaneously and permits large quantities of acid to be eliminated.

The concentration of bicarbonate in the acid-base table is given as 25 mEq per liter of arterial plasma. This is the concentration of carbon dioxide bound to base. An

Additional mill amount, approximately  $\frac{1}{20}$  of 25 ml q per liter is in solution in the water of the plasma. This is free carbon dioxide the concentration of which is conditioned by the partial pressure of carbon dioxide in the alveolar air which is dependent successively on pulmonary ventilation. The sum of free and bound carbon dioxide is known as total carbon dioxide content the amount obtained from the Van Slyke gasometric determination. The total carbon dioxide content of plasma in healthy persons is of the same order of magnitude as the carbon dioxide combining power. There may be a considerable discrepancy, however, between these values in certain disturbances of acid base balance. Determination of total carbon dioxide content is to be preferred to determining combining capacity as it is a more reliable procedure and productive of more information.

The  $pH$  of plasma is dependent on the ratio of free to bound carbon dioxide as well as the total content of carbon dioxide. When this ratio is disturbed acidosis or alkalois results. Acidosis such as is observed in nephritis and in diabetic coma is associated with a decrease in concentration of total carbon dioxide. This depression is reflected in both free and bound carbon dioxide with a relatively greater effect on the bound fraction. On the other hand the similar type of alkalois which follows the ingestion of alkali powders is accompanied by an increased total carbon dioxide content with a relatively greater increase in bound carbon dioxide.

Since the  $pH$  of plasma is determined by the ratio of free to bound carbon dioxide there are two other possible combinations of acid-base disturbance. Both are relatively uncommon and follow an unorthodox pattern. Hysterical hyperventilation is an example of alkalois with the total carbon dioxide content of the plasma below normal.<sup>19</sup> Superficially one might expect acidosis with a low carbon dioxide content. The body fluids show increased alkalinity, however, since free carbon dioxide is reduced proportionately more than bound carbon dioxide. On the contrary with obstruction of the respiratory passages or emphysema an acidosis results. The total carbon dioxide content of the blood, meanwhile, is above normal. The elimination of carbon dioxide from the alveolar spaces is impeded free carbon dioxide accumulates in the plasma and the ratio is shifted to the acid range.

Sweating, like respiration, is a highly integrated process. The excretion of water in the sweat is necessary for dissipation of heat and maintenance of body temperature. It is expensive for the body, however, because of the seemingly unnecessary loss of salts. The content of sodium and potassium salts in sweat is appreciable, but they serve no known purpose. The sweat glands are developed sufficiently to elaborate a protein free filtrate of plasma, but they cannot produce a salt free filtrate. The concentration of sodium chloride is one fifth to one-half as great as in plasma. The quantity, however, which may be dissipated daily by profuse sweating is not widely appreciated. Many persons sense that strenuous exercise in a high environmental temperature is accompanied by excessive sweating and salt loss. On the other hand, few persons are aware that a sedentary existence in a hot environment or

strenuous exercise in a cold environment may be associated with a dissipation of significant quantities of sodium chloride. If strenuous exercise in a cold environment is undertaken by persons suitably clothed in woollens for protection sweating is profuse and loss of salt may be significant. The matter of sodium chloride deficiency is of concern therefore to persons living in cold as well as in warm climates and to members of our armed forces undergoing heavy maneuvers in cold regions as well as in tropical regions.

The volume of sweat lost during eight hours of strenuous work in a hot environment may be as great as 10 or 15 liters each liter containing as many as 3 or 4 gm of sodium chloride. Somewhat smaller amounts may be lost daily by patients with fevers. No ill effects may be attributed to the excessive exchange if amounts lost are replaced periodically. If this is not achieved symptoms of sodium chloride deficiency may appear. Fluid depletion usually accompanies salt lack, such as in dehydration but sodium chloride deficiency per se is associated with certain symptoms.

The gradual development of uncomplicated salt deficiency in a sedentary person leads to weakness, excessive fatigue, moroseness and nausea.<sup>20</sup> Physical performance is impaired and mental acuity diminished. A thirstlike sensation may appear which is not alleviated by ingestion of fluid. This sensation may be all that remains of the reaction of animals to lack of salt. There is no change in rate of resting pulse, blood pressure or body temperature. The development of many of these symptoms in hot climates has been attributed to some mysterious action of the tropics and has been called tropical languor. Be this as it may, sodium chloride deficiency is a real phenomenon and militates against optimal physical and mental performance.

If salt loss is accompanied by fluid loss, the usual consequence of strenuous activity, muscle cramps and prostration may develop. In previous writings these syndromes have been called heat cramps and heat prostration<sup>21</sup> because they have appeared usually in persons exposed to high environmental temperatures. With the recent interest in winter sports and the military campaigns of World War II, muscle cramps at least may be observed following strenuous exercise in cold regions as well as in hot regions. A more appropriate title, therefore, might be muscle cramps from salt loss rather than heat cramps. A syndrome similar to heat prostration probably is rare in cold environments. It is temporarily incapacitating in hot climates but is not a serious malady. During the 1941 army maneuvers in Louisiana and in the Carolinas several hundreds of soldiers were stricken with this malady. Attention to adequate sodium chloride intake will undoubtedly prevent similar disabilities in actual combat.

Muscle cramps from salt loss are painful spasms of the voluntary muscles and develop in persons engaged in strenuous physical activity. The pathogenesis of symptoms has been shown to be a function of decreased sodium chloride content of the body and not to water intoxication. Susceptibility to cramps varies among persons as well as with the duration of exposure to conditions which induce cramps. Susceptibility may

reach a maximum during the first days of excessive sweating before adjustment and acclimation begin to operate. Acclimation is associated with a decreasing concentration of sodium chloride in the sweat, although the volume of sweat excreted may be unchanged. Particular attention should be given to salt intake during the first days of excessive sweating if cramps are to be avoided.

The prevention and treatment of sodium chloride deficiency is theoretically and practically a relatively simple matter. The salt intake should be increased if exposure to high temperatures is anticipated or if physical activity in the cold is contemplated. A daily intake of 15 Gm of sodium chloride will protect against most symptoms of salt deficiency. Some persons will consume this amount in a high salt diet. Others need extradietary salt as salt tablets or a saline drink. If a central supply of drinking water is available such as in mills, in shops or in army barracks, table salt may be added at some convenient point to make a final concentration of 0.1 per cent. A solution of this low concentration has only a slightly saline taste if it is consumed cool and allays rather than promotes the sensation of thirst. It is thought to be the physiologic way to replace salt lost in the sweat. Since the body has a mechanism for detecting loss of water, i. e. thirst, only sufficient water will be ingested to satisfy this desire. With replacement of water, salt is replaced but only as is needed to restore amounts lost by sweating. In installations where the general salting of drinking water is not feasible, such as in combat bivouacs, reliance must be placed on salt added to food or contained in salt tablets. A 1 Gm salt tablet (15 grains) may be taken with each half liter of water or a 0.5 Gm tablet (7½ grains) taken with each cup of water. Although these recommendations are applicable to persons excreting excessive quantities of sweat daily, other persons, including those at sedentary jobs, will benefit from an increased salt intake during hot weather. The hazards to be considered from the recommendation on such a broad scale for use of liberal amounts of salt are not believed to be significant. The kidneys are capable of excreting any excess salt ingested except in renal failure and in the presence of edema. Of course if added salt is taken in the drinking water and thirst is allowed to dictate fluid requirements, the salt level in the body is merely maintained and the normal range is never exceeded.

A liberal intake of fluid is imperative for persons subjected to excessive sweating in hot weather. It is needed to provide available quantities for dissipation of heat as well as to maintain the internal environment of the body. The temperature at which water should be consumed may be governed by individual tastes. There is little evidence that cool water by itself is harmful. It has the advantage of a refreshing action in comparison with tepid water. The moderate use of nonalcoholic bottled beverages by adults subjected to considerable physical exercise in the summer is generally considered to be unobjectionable. The belief that an excessively low protein diet is necessary in hot weather is without experimental confirmation. An adequate protein intake (from 60 to 100 Gm daily), in addition to supplying protein necessary for maintenance of muscle mass, provides more sodium chloride than a low protein intake.

The gastrointestinal tract requires a very small amount of fluid to keep the fecal mass from complete

desiccation. Large amounts of fluid may be lost in sickness associated with emesis or diarrhea. Gastric juice contains a great deal of chloride but a relatively low concentration of base. Diarrhea discharges, on the other hand, tend to be alkaline with a preponderance of base, especially potassium.

Lastly, the kidneys excrete the remainder of available fluid after the demands of the lungs, skin and gastrointestinal tract have been satisfied. It is not intended to imply by this statement that this is a haphazard process, for in fact it is a very precise one. The kidneys are the buffer organ for fluid excretion, they also serve as a vital excretory organ for waste products and share with the lungs in the regulation of the acid-base equilibrium. The functions of excretion and acid-base regulation are performed by the nephrons, the functioning units of the kidneys, of which there are more than two million in a normal person. The nephrons are composed of the glomerulus, convoluted and collecting tubule and a blood supply. The afferent arteriole enters the glomerulus, carries blood to the glomerular capillaries for the elaboration of glomerular filtrate, becomes efferent after leaving the glomerulus, continues in intimate contact with the convoluted tubules through a second capillary network, and, after the functions of excretion and reabsorption are performed, becomes a venule. This schematic functioning unit of the kidney as presented by Smith<sup>22</sup> is a useful concept, as will be evident in the discussion of the specific duties of water and salt exchange. There is little support for the thesis that individual glomeruli and nephrons are active and inactive periodically or rhythmically. They are probably all working at the same optimum level in health, and what is happening to one is probably an index of what is happening to all. Anatomic and functional changes alter this situation in disease.

Approximately 12 liters of whole blood passes through the nephrons each minute. This is called effective renal blood flow<sup>23</sup> and is approximately one third of the total cardiac output. No other tissue of the body save for the lungs claims proportionately as great a volume of blood. The measurement of flow of blood to the kidney whereby this value is derived is an ingenious procedure. If a few cubic centimeters of diodrast, the same preparation used for pyelography, is introduced intravenously, a plasma level of approximately 2 mg per hundred cubic centimeters may be achieved. All the diodrast at this plasma level which enters the afferent arterioles of the kidney is removed from the blood in the glomerular and tubular capillary networks. A portion is removed in the glomerular filtrate, the remainder by the excretory activity of the tubules. It is not important in the calculation of renal blood flow to consider the paths of removal from the blood. It must be assumed, however, that diodrast is not altered during its passage through the kidneys and that all the diodrast in renal arterial blood is removed by the nephron before the venule is reached and is excreted immediately into the collecting tubules. If the concentration of diodrast in the blood is determined accurately from a sample of plasma and the amount of

N U M B E R 17

dioctate excreted per minute by the kidney is determined by urine analysis, it is possible to calculate renal blood flow. As an example, if the concentration of dioctate in the plasma is 2 mg. per hundred cubic centimeters and 14 mg. of dioctate is excreted per minute into the bladder, then 700 cc. of plasma must have entered functioning nephrons to provide for this quantity of dioctate. The calculation of whole blood flow from plasma flow is possible if the cell volume-plasma volume ratio is determined by the hematocrit reading. If whole blood contains 40 per cent of cells and 60 per cent of plasma the plasma flow of 700 cc. is only 60 per cent of the total whole blood flow. Therefore  $\frac{700}{60} \times 100 =$  approximately 1,200 cc.  $\rightarrow$  renal whole blood flow.

The next step to be considered in the analytic dissection of the elaboration of urine is the formation of glomerular filtrate from a portion of the effective plasma flow. Rate of formation of glomerular filtrate is measured by clearance of inulin or mannitol,-- starchlike polymers. They are not metabolized by the body if injected intravenously and appear unchanged in bladder urine. The path of excretion is exclusively through the glomerular membrane, the tubules neither reabsorb nor excrete either substance. If the concentration of inulin in the plasma is elevated to 100 mg. per hundred cubic centimeters and 125 mg. of inulin is excreted by the kidney into the bladder per minute, 125 cc. of plasma must have participated in the formation of glomerular filtrate to allow this quantity of inulin to be excreted. The rate of formation of glomerular filtrate is therefore 125 cc. per minute. This is characteristic of a healthy man, about one fifth of the effective renal plasma flow is concerned with glomerular filtration.

The formation of glomerular filtrate is the result of the excess hydrostatic pressure in the glomerular capillaries over and above the combined osmotic pressure of the plasma proteins and intraglomerular pressure. Formation of filtrate continues until the osmotic pressure of the plasma, due to concentration of proteins, increases and equalizes the pressure inside and outside the glomerular capillaries. Plasma proteins do not pass through the capillary walls, and a protein free filtrate of plasma is elaborated in the glomerulus. The concentration of electrolytes in glomerular filtrate except for protein is similar to arterial plasma. The qualitative and quantitative integrity of body water is thus maintained. After the formation of glomerular filtrate, the plasma with proteins which have been concentrated nearly 20 per cent flows into the efferent arteriole and subsequently into the contiguous capillary network about the tubule, where the remaining functions of renal activity are performed. Such functions include reabsorption of a large portion of glomerular filtrate, formation of ammonia and elimination of waste products by failure to reabsorb them. Most of the glomerular filtrate is attracted back into the capillary network through the tubular epithelium by virtue of the increase in osmotic pressure of the plasma, which has exceeded the decreased hydrostatic pressure. Approximately 90 per cent of the water and salts of the glomerular filtrate are reabsorbed by this mechanism. Urea, carbon dioxide and phosphate are the principal waste products that are not reabsorbed in proportion to fluid. All except 1 or 2 per cent of the remaining 10 per cent of the fluid of glomerular filtrate is reabsorbed by the tubular epithelium because of the presence of the antidiuretic hor-

none from the posterior pituitary gland. Only 1 or 2 per cent of the glomerular fluid in healthy persons finally finds its way into the bladder. This seemingly small percentage, however, is sufficient to account for the formation of 2 liters of bladder urine daily. One per cent of 125 cc. equals 1.2 cc. a minute, 70 cc. an hour and 1,800 cc. in twenty-four hours.

The amount of glomerular filtrate formed is a remarkably constant function under controlled conditions and is not dependent on amount of fluid available for excretion into the bladder. A normal person with a surface area of 1.72 square meters should form approximately 125 cc. of filtrate a minute in the basal state. The mechanism of the action of the antidiuretic hormone which is responsible for variation in urine output depending on amount of available fluid has been summarized by Verney<sup>24</sup> as follows: "The administration of water causes, presumably through the mechanism of the central nervous system, an inhibition of the secretory activity of the pituitary gland. The preformed antidiuretic hormone gradually disappears from the circulating blood but for a time, about thirty minutes, is present in sufficient concentration to restrain the activity of the kidney. As the concentration of pituitary hormone in the circulating blood diminishes, the rate of urine formation increases to a maximum. When as a result of diuresis much of the water excess is removed, the secretory action of the pituitary gland is resumed and the rate of urine formation diminishes."

The exchange of electrolytes by the kidney follows a channel similar to water. There is no conclusive evidence that any of the electrolytes are excreted by tubular activity. Most of the inorganic bases and acids in glomerular filtrate are reabsorbed to maintain the concentrations in the body. Since sodium and chloride are the predominant electrolytes in plasma, they are the predominant electrolytes in glomerular filtrate. Potassium is present in relatively low concentration in the plasma and may be reabsorbed by different tubular cells than those which reabsorb sodium, at least there is no reciprocal excretion of sodium and potassium by the kidney. On a high potassium intake, several times the quantity of potassium may be excreted in the urine as during a low potassium regimen, the sodium excretion meanwhile undergoes little change.<sup>25</sup>

Approximately 90 per cent of the sodium (and chloride) in glomerular filtrate is reabsorbed through the tubular epithelium because of the increased osmotic pressure. All of the remainder that is reabsorbed is subject to hormonal control just as is fluid. Desoxycorticosterone or a similar substance elaborated by the adrenal cortex exercises the control. Other steroids, such as esterone, progesterone and testosterone,<sup>26</sup> may participate, but their sodium retaining property is much weaker than that of desoxycorticosterone. In adrenal insufficiency, with inadequate elaboration of cortical hormones, normal quantities of sodium are not reabsorbed by tubular epithelium and a dissipation of this electrolyte in the urine is evident. The action of desoxycorticosterone may be demonstrated in normal persons

following an injection of this substance as well as in patients suffering from a deficiency of it

An important contribution to our knowledge of sodium exchange has been made recently. While retention of pathologic amounts of sodium during the treatment of Addison's disease may follow excessive assimilation of the synthetic hormone desoxycorticosterone, abnormal retention of sodium has never been demonstrated following administration of excessive quantities of cortical extract prepared from animal adrenals. The explanation of this paradox has been presented by Thorn and his associates.<sup>27</sup> They have shown that 17-hydroxycorticosterone, one of the active principles in commercial preparations of adrenal cortex extract, has a demonstrable sodium excreting property which may be as potent as the sodium retaining property of desoxycorticosterone. During the use of adrenal cortex extract, the sodium retaining and sodium excreting factors are approximately balanced and edema does not develop. A similar mechanism presumably operates in health to maintain the constancy of sodium in the body.

Phosphate and bicarbonate participate in the regulation of acid-base equilibrium, particularly in the acidification of urine, during their elimination from the body. The reaction of glomerular filtrate is neutral, the reaction of bladder urine is acid. Two functions are achieved in the transformation of neutral glomerular filtrate into an acid urine. Base is retained and acids are lost. It is imperative that available base be retained, since the body has only a limited supply. All of the inorganic base found in the body is ingested in food and none is manufactured. Acids, on the other hand, are products of metabolism, they are manufactured in large quantities and must be excreted if life is to be maintained. Phosphate contributes to this regulation because it is a trivalent acid. Most of the phosphate (80 per cent) is dibasic at  $pH$  7.4, the reaction of glomerular filtrate. As the urine becomes acid, it loses its dibasic property and at 4.8 it is present as a monobasic salt. Base is thus conserved, while the quantity of acid which may be excreted is not diminished. Bicarbonate achieves a similar result by allowing base to be reabsorbed by tubular epithelium, leaving high concentrations of carbonic acid available for excretion in bladder urine.<sup>28</sup> Yet a third process participates in excretion of acid. This is the formation of ammonia from amino acids in the tubular epithelium. Quantities of ammonia are formed for neutralization of acid substances in health as well as in acidosis, meanwhile allowing inorganic base to be returned to the body.

There are two conditions which illustrate physiologic fluctuations and quasipathologic states of water and salt exchange. These are diuresis and dehydration, respectively. Diuresis is an interesting aberration of renal function which may be induced by an increased intake of fluid or by one of several drugs or chemical substances. Diuretics do not increase appreciably the rate of formation of glomerular filtrate. Some diuretics increase slightly the flow of blood through the kidney, but urine output is not affected by this increase alone. The principal effect is impaired reabsorption of water

and salt by the tubules. The osmotic diuretics dextrose, sucrose and urea are present in high concentrations in glomerular and tubular urine and, because of their intrinsic osmotic pressure, they prevent normal reabsorption of water and salt. The xanthine diuretics are quite different chemical substances, although their action on renal exchange is similar to the osmotic diuretics. A small increase in rate of glomerular filtration is overshadowed by a significant depression in reabsorption of tubular urine. The action of the mercurial diuretics is solely on the reabsorptive mechanism, no extrarenal action has ever been demonstrated, nor is there any increase in rate of formation of glomerular filtrate.<sup>29</sup>

Dehydration may be caused by a number of disturbances and varies in degree from a mild state without detectable clinical signs to alarming severity associated with profound prostration and collapse. Either inadequate intake or excessive loss of water and salt from the gastrointestinal tract or kidneys may be responsible. During the early stages of uncomplicated dehydration there is a diminution in volume of interstitial fluid and plasma, while the composition of plasma with respect to water and salt concentration is maintained. If the disturbance is allowed to progress, interstitial fluid volume and plasma volume continue to decrease, and eventually serious alterations in electrolyte concentrations in the blood may be demonstrated. Serum protein, hematocrit and red blood cell counts are increased, while concentrations of serum sodium and chloride are decreased. If dehydration is complicated by acidosis, such as in untreated diabetes mellitus, the serum bicarbonate is decreased. On the other hand, in dehydration from loss of gastric juice, as in pyloric obstruction, the reaction of the blood is alkaline and the concentration of blood bicarbonate is increased. An increase in concentration of nonprotein nitrogen is a late effect produced by renal failure and by increased breakdown of body protein if supplies of carbohydrate are depleted.

Renal blood flow and formation of glomerular filtrate are unimpaired in the early stages of dehydration. Because of the ability of the human kidney to make a hypertonic urine, nitrogen products continue to be excreted with a very small urine flow while essentially all the sodium chloride is reabsorbed. Compensation cannot be maintained indefinitely as dehydration progresses and with a decreasing plasma volume renal blood flow diminishes. The viscosity of the blood is increased as the proteins are concentrated, hydrostatic pressure becomes inadequate to form glomerular filtrate and formation of urine ceases. One or more days usually elapses before the appearance of anuria in untreated adults.

The treatment of dehydration is not as complicated as the recognition of the several chemical changes. Interstitial fluid has probably suffered the greatest volume change. This can best be restored by physiologic solution of sodium chloride. Such a solution contains relatively more chloride than does plasma or interstitial fluid, but, if the kidneys have not ceased functioning, any excess of chloride is excreted, leaving sodium to combine with carbon dioxide. Acidosis is thereby alleviated. Dextrose may be added to salt solution and is especially indicated if ketosis is present, but it should not be given initially in place of saline solution.

Wide blood or plasma is indicated to restore colloid osmotic pressure if blood loss or starvation complicates the clinical state. Profound acidosis should be treated with alkaline solutions in spite of many prejudices which have appeared in the literature condemning them. No harm should result from their judicious use and less of a burden is put on the kidneys for regulation of acid base balance of the body. Sodium bicarbonate lactate is very popular in American clinics and has largely replaced bicarbonate solution. One sixth molar sodium lactate is isotonic and is made by adding one part of molar sodium lactate solution to five parts of sterile distilled water.<sup>3</sup> The approximate lactate requirements may be calculated if the level of bicarbonate in the blood is known. As an approximation 10 cc. of solution per kilogram of body weight is required to raise the carbon dioxide content of the blood 10 volumes per cent. If dehydration is accompanied by alkalosis saline solution usually suffices. The value of Ringers and other complex solutions over physiologic solution of sodium chloride in adults is doubtful, although in infants and children replacement of calcium and potassium as well as sodium may be necessary. The intravenous route for parenteral therapy is to be preferred. Subcutaneous injections are painful and usually unnecessary. Theoretically, parenteral therapy should continue until restoration of water and salt concentrations and restoration of body weight. Practically it is feasible to relax vigilance with partial restoration, and, once the vicious chain of events has been halted, the homeostatic processes of the body are able to act effectively.

## Council on Foods and Nutrition

THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT  
FRANKLIN C. BIGG, Secretary

### THE COMPARATIVE NUTRITIONAL VALUE OF BUTTER AND OLEOMARGARINE

For many years the average annual per capita consumption of table fats in this country has been 20 pounds. During the past thirty years the per capita consumption of butter has varied from 13.9 to 18.7 pounds and oleomargarine from 1.1 to 3.4 pounds. These are average figures, and many people never consume oleomargarine while others may use mostly oleomargarine with little or no butter.

Regardless of the nutritional significance of these food products, we must admit that their consumption is based to a very large extent on custom, habit and income. No one food is indispensable in the diet, and we can cite many areas in the world where neither butter nor oleomargarine is consumed. In the United States, however, butter has been a favorite food through many generations. A large percentage of the early farm homes were equipped with churns in order to convert cream into butter, which was less perishable. The factory production of butter and oleomargarine is a more modern development.

The nutritionists are interested in adequate nutrition for all individuals. They are not concerned about what specific foods supply the essential nutrients, but they are interested in the possible ill effects of sudden shifts from one type of food to another. Butter has already been involved in one of these problems. The rapid increase in ophthalmia in Denmark in 1917 due to a sudden decrease in butter fat consumption, which

has been so clearly described by Bloch<sup>1</sup> is familiar to most of us. Owing to our increased knowledge of nutrition and the availability of concentrated food products, such sudden changes can be averted more easily today than ever before, but we must still be alert for new changes.

In light of these past experiences we are continually being asked whether increased consumption of oleomargarine will have a detrimental effect on the health of our nation. A United States patent for making oleomargarine was issued in 1873. In 1886 an act of Congress legalized the manufacture of oleomargarine and placed a stamp tax of 2 cents a pound on all oleomargarine. The federal law has been changed six times by amendment. In 1902 the tax of 2 cents a pound was reduced to 0.25 cent on oleomargarine free from artificial coloration that causes it to look like butter of any shade of yellow. If artificial color was used to give the product a yellow color, the tax was 10 cents a pound. In 1931 this tax was changed to make all oleomargarine that was yellow subject to the 10 cent tax. At present every state except Arizona has some kind of oleomargarine legislation but there is great variation among the states. Regardless of the motive behind many of these laws it is very significant from a nutritional point of view that the federal government made it possible for the consumer to distinguish between butter and oleomargarine. In 1902 the importance of the distinction was not clear, but by 1913 it was evident that vegetable oils and many of the animal fats used in making oleomargarine were devoid of vitamin A, while butter was a rich source of this vitamin. Thus any substitution of oleomargarine for butter would directly decrease the vitamin A intake. However, today, as a result of the availability of vitamin A concentrates, it is possible to fortify the oleomargarine so that its vitamin A content may equal that of a high grade butter. At present about 85 per cent of the oleomargarine is fortified.

The kind of fat used in making oleomargarine has also changed during the past few years and will probably continue to change depending on the availability of different oils. In 1933 coconut oil made up 75 per cent of the fat used, while last year it contributed 85 per cent of the materials used. About ten times as much cottonseed oil is used today as ten years ago, and soy bean oil now contributes about one third of the total oil used.

We should therefore give more detailed consideration to the possible differences in the nutritional value of butter and oleomargarine as they are produced today. Butter is "understood to mean the food product usually known as butter, and which is made exclusively from milk or cream or both, with or without common salt, and with or without additional coloring, and containing not less than 80 per cent by weight of milk fat, all tolerances having been allowed for." Oleomargarine is defined as a food made from either animal or vegetable fats or a combination of animal and vegetable fats. These fats are mixed with either cream, milk, skim milk or dried skim milk and water, or with some combinations of these. The finished product must contain not less than 80 per cent fat. In addition to these required ingredients the new standards adopted by the Food and Drug Administration Sept. 6, 1941, permit the use of seven optional materials: (1) artificial color, (2) sodium benzoate or benzoic acid, (3) vitamin A with or without vitamin D, (4) diacetyl, (5) lecithin, (6) butter (no butter has been used in oleomargarine manufacture since 1935), (7) salt. The composition of a number of oleomargarines given in Accepted Foods, pages 42-43, shows that most of them contain from 80 to 82 per cent of fat.

In the light of modern nutritional knowledge, foods such as butter and oleomargarine may be of significance in the diet for the following reasons:

- 1 Concentrated form of energy
- 2 Source of essential fatty acids
- 3 Carrier of fat soluble vitamins
- 4 Effect on requirement of other nutrients
- 5 Source of possible unidentified factors

1. Bloch C. E. Blindness and Other Diseases in Children Arising from Deficient Nutrition (Lack of Fat Soluble A Factor) Am. J. Dis. Child 27: 139 (Feb.) 1924.

1 In order for these food products to exert any or all of these effects, the fat must be properly digested. There is no significant difference in the digestibility of butter and oleomargarine. Langworthy<sup>2</sup> has shown that most of the common fats are utilized to an extent of at least 93 to 98 per cent by the human body and can be tolerated in sufficient quantity to furnish 1,000 calories, or more than one third of the average daily energy consumption. Steenbock, Irwin and Weber, and Deuel and his co-workers have studied the rate of fat absorption in rats. Steenbock, Irwin and Weber<sup>3</sup> found butter oil, halibut liver oil and cod liver oil to be absorbed at a more rapid rate than lard, corn oil or partially hydrogenated fats, with butter falling between the two groups. They did not determine whether the rapidity of absorption was physiologically advantageous. Deuel and his co-workers<sup>4</sup> found no consistent difference in the rate of absorption of hydrogenated cottonseed oil, butter fat or coconut oil.

A gram of these fats yields 91 to 93 calories of heat or energy. While carbohydrates and part of the ingested proteins can also serve as a source of energy, the replacement of fat in the diet is limited. Stirling<sup>5</sup> stated that "The question of bulk is probably one of the most important factors in determining the need for fat. The human alimentary canal has been developed so as to cope with a diet in which 20 to 25 per cent of the energy is presented in the form of fat." Further discussion of this question is made by Anderson and Williams.<sup>6</sup> Drummond recently reported to the Food and Nutrition Board of the National Research Council that the decreased fat intake in England was a serious question previous to the lend lease act. Thus the presence of appreciable amounts of fat (one fourth to one third of the total calories) in the American diet is an important factor.

Carlson<sup>7</sup> points out that the factor of palatability is of no small importance in insuring an intake of necessary types and amounts of food. Depending on previous habits, the use of butter or oleomargarine may have an important effect on the consumption of other foods.

2 It is well known that natural fats differ in the amount of unsaturated fatty acids present and that certain of the fatty acids appear to be essential in the nutrition of animals (Burr<sup>8</sup>). Careful exclusion of fat from the diet of rats leads to development of scaly skin, pronounced retardation of growth, kidney lesions, hematuria and early death. There are three unsaturated fatty acids, namely linoleic, linolenic and arachidonic acids, which are effective in preventing these symptoms, although the individual acids differ somewhat in their specific effects. Natural fats which are most effective in curing this disease are corn oil, linseed oil, olive oil and lard. Butter and coconut oil even at fairly high levels were not nearly as active in curing the condition. According to Eckstein,<sup>9</sup> butter may vary from 0.2 to 0.5 per cent of linoleic acid. Hilditch and Sleightholme<sup>10</sup> report the linoleic acid content of butter to be from 1.9 to 3.7 per cent. The linoleic acid content of oleomargarine will vary, of course, depending on the fats used in its manufacture, but it may be quite high if cottonseed oil is used in considerable amounts. The untreated cottonseed oil may contain 35 to 50 per cent of linoleic acid, however, the oil is usually hydrogenated, but even a hydrogenated cottonseed oil may contain 13 per cent of linoleic acid according to chemical assays.

(Hoagland and Snider<sup>11</sup>) On the basis of rat assays, Burr<sup>12</sup> has found approximately 2 to 5 per cent of linoleic acid in oleomargarine and 1 to 4 per cent in butter.

Even though butter fat is lower than the oleomargarines in the essential unsaturated acids, there is apparently sufficient present to meet the demands when whole mineralized milk is used as the sole article of diet. Rats have been maintained for long periods of time in excellent health on such a diet, and Anderson, Elvehjem and Gonce<sup>13</sup> have maintained dogs on such a diet for three years with the comment that the animals had very excellent fur coats. Infants, of course, have been maintained on milk diets for long periods of time. There may be a small amount of linoleic acid in the phospholipids of the skim milk, and the high lactose intake may have some sparing effect when whole milk diets are used. Some difficulty in rats has been reported when 9 per cent of butter fat has been used in synthetic diets as the sole source of fat, but this difficulty may be due in part to the development of rancidity in these purified rations, which would cause rapid destruction of the unsaturated fatty acids.

Some question has been raised about the importance of unsaturated fatty acids in human nutrition and it must be admitted that very little work has been done on human beings. Brown and his co-workers<sup>14</sup> kept two infants on a diet extremely low in fat and observed no symptoms except repeated mild attacks of impetigo. They did find a moderate decrease in the degree of unsaturation of the serum fatty acids. Hansen<sup>15</sup> has reported a similar decrease in infants suffering from severe eczema. Brown and his co-workers maintained an adult for a period of six months on a low fat diet which produced the typical fat deficiency syndrome in rats without demonstrable harm in the man. Linoleic and arachidonic acid contents of the blood serum did show a decrease. The highly unsaturated fatty acids should be provided in the diet of human beings, but it appears that for individuals on average diets no difficulty in this respect will be observed by shifting from butter to oleomargarine or vice versa.

3 Many fats are important carriers of the fat soluble vitamins, in fact, the original discovery of vitamin A was dependent on the use of fat poor experimental diets. Butter fat was used in many of these early studies and it was soon recognized that vegetable fats and many animal tissue fats were devoid of vitamin A. While butter fat has served as an important source of vitamin A in temperate zones, fish oils have played a similar role in arctic regions.

Most workers agree that many unfortified oleomargarines contain insignificant amounts of vitamin A. Some of the oleomargarines made from beef oleo oil may carry fair amounts of vitamin A. A significant portion of the oleomargarine is now fortified to an extent of 9,000 international units per pound. All the oleomargarine sold as a table fat should be fortified. The vitamin A content of butter is known to vary depending on the feed of the cow, but most of the butter produced in the dairy belt of the United States will contain 5,000 to 20,000 international units per pound. According to the values given by Dornbush, Peterson and Olson<sup>16</sup> the minimum value for winter produced butter fat is 3 micrograms of carotene and 7 micrograms of vitamin A per gram. The maximum value for summer produced butter fat is 10 micrograms of carotene and 13 micrograms of vitamin A per gram. Assuming that 1 pound of butter contains 378 Gm of butter fat and that 1 international unit = 0.6 microgram of carotene and 0.3 microgram of vitamin A, the foregoing values give 10,584 to 22,200 international units per pound. In isolated areas where the feeding practices

even poorer, values below 10,000 international units per pound may be obtained. There may be some loss of vitamin A in hardening, storage, but fortified oleomargarine is also subject to this.

If we use the average per capita consumption of butter (17 pounds) and the average vitamin A potency as 12,000 international units per pound, butter can supply between 200 and 200,000 international units daily to each person in the United States. Many persons eat twice the average amount of butter and would therefore obtain one-fourth of their total daily requirement from butter. It is obvious that only fortified oleomargarines and butter can be compared when the vitamin A is considered.

Butter contains from 50 to 500 international units of vitamin D per pound (Willner<sup>17</sup>). This is not a rich source, but a generous intake of butter may supply one-sixth of the total requirement. Oleomargarine is practically devoid of vitamin D although it may carry significant amounts in fish liver oils added for the addition of vitamin A. In England both vitamins A and D are added to margarine. The Council supports special claims for the vitamin D added to oleomargarines in this country.

Butter is low in vitamin E although there is sufficient in whole milk to allow reproduction in rats and dogs. Since the oleomargarines are rich sources of vitamin E, oleomargarine and all carry appreciable amounts of this vitamin in the oleomargarines are properly prepared. No nutritional claims are recognized for vitamin E at the present time.

Although the vitamin K content of butter has not been determined accurately, it is obvious that butter contains relatively little of this vitamin. Oleomargarine also carries relatively little vitamin K since the seeds of plants contain less vitamin K than do the leafy parts of the plant. Since the requirement for vitamin K may be satisfied by intestinal synthesis at least in adults, any difference in the amount of this vitamin in butter and oleomargarine is not of any great significance. In summary, then, butter supplies more vitamin A and vitamin D than oleomargarine unless it is fortified, and oleomargarine supplies more vitamin E than butter.

4 Evidence has been accumulating to show that the amount of fat in the diet may affect the body's requirement for other nutrients. In experimental animals the isocaloric replacement of sucrose with fat produces a significant decrease in the vitamin B<sub>1</sub> requirement. Natural fats such as butter, lard or corn oil all produce the same effect.<sup>18</sup> In the rat high levels of fat appear to increase the riboflavin requirement, but again all fats function equally.<sup>19</sup> When animals are placed on a diet of skim milk fortified with minerals, a large percentage of the ingested galactose or the milk sugar is excreted in the urine.<sup>20</sup> When butter fat, lard, corn oil and coconut oil were added to the diet to the extent of 3 to 4 per cent, the loss of galactose in the urine was prevented.

The significance of choline in animal nutrition is now definitely established,<sup>21</sup> although its importance in human nutrition is not clear. At first thought one would expect the fats in the diet to supply much of the needed choline, however, purified fats have probably lost much of their phospholipid choline. Cereal products and skim milk, which carry little or no fat, supply much of the choline as well as other substances exerting a choline like effect, needed in the diet.

In the rat, unsaturated fatty acids may have some sparing action on vitamin B<sub>12</sub>, however, the significance of unsaturated fatty acids in human nutrition has already been discussed. According to present knowledge, then, the ingestion of butter or oleomargarine will not alter the requirement of other nutrients to any significant degree.

5 In studies designed to measure any possible difference in the nutritive value of butter and vegetable oils, Schantz, Elvehjem and Hart<sup>22</sup> showed that butter fat homogenized into raw skimmed milk with ample fat soluble vitamins and minerals added gave better growth when fed to weanling rats than did corn oil, coconut oil, cottonseed oil and soy bean oil fed in a like manner. The differences are most readily obtained in young growing rats and when the diet contains lactose. The factor responsible for the superior growth follows the saturated fraction of the butter fat.<sup>23</sup> The unsaturated fraction of butter fat is relatively rich in a compound which by hydrogenation may be converted to an active compound. Corn oil, coconut oil, cottonseed oil and soy bean oil apparently do not contain this compound since hydrogenation of these vegetable oils does not improve their nutritive value when incorporated into skim milk.<sup>24</sup> That butter fat should have a different nutritional effect is not surprising, since several additional fatty acids have been isolated from butter fat (Hilditch<sup>25</sup>). Similar differences have been obtained by Gullickson and his co-workers<sup>26</sup> using calves as the experimental animal. They also found that the animal rats such as lard and tallow gave results similar to those obtained with butter fat. It is most interesting that some of the calves on a low fat diet made excellent gains and were healthy and thrifty. Thus the level of fat in the diet is very important in estimating the superior values of animal fats over vegetable fats. It is well known that rats grow very well on synthetic diets containing 2 per cent of corn oil. Euler and her co-workers<sup>27</sup> obtained better growth in rats on a purified diet containing oleomargarine than on a similar diet containing butter fat. The percentage of fats in their diet was also lower than that in whole milk and the rate of growth in all their animals was rather low. It is possible that both rats and calves are able to synthesize additional fatty acids when they are on low fat diets.

Whether these results enter into the question of the relative value of butter and oleomargarine in human nutrition remains to be determined. Holt and his co-workers<sup>28</sup> have reported that soy bean oil is superior to butter fat in infant nutrition because the oil is more easily absorbed than butter fat. At present it is unknown whether the factors indicated to be essential in the animal experiments are needed by human beings. If they are needed they are probably more important in growing children than in adults. It they must be supplied in the diet the other ingredients or the diversified diet consumed by most adults will probably supply sufficient amounts of the factor. Many of the oleomargarines now manufactured contain some animal fats in addition to the vegetable oils. These animal fats should supply the same factors that are present in butter fat.

It is therefore possible to conclude that at present there is no scientific evidence to show that the use of fortified oleomargarine in an average adult diet would lead to nutritional difficulties. A similar statement is probably justified in the case of growing children, but preliminary results from animal experiments indicate that more work is necessary before any specific conclusions can be made. Since the nutritional factors have not all been identified and since butter contains numerous additional fatty acids of unknown nutritional significance, the consuming public has a right to demand that the practice of identifying oleomargarine and butter so that any one can differentiate between them should be continued.

## EPIDEMIOLOGY OF LYMPHOCYTIC CHORIOMENINGITIS

Although occasional references appear in older medical writings to an acute aseptic meningitis, Wallgren in 1925 first described a small epidemic in Sweden of what is now called lymphocytic choriomeningitis in which the probable nonbacterial infectious nature was recognized. The causative virus was isolated by Armstrong and Lillie<sup>1</sup> from a patient with atypical fatal meningitis during the St. Louis epidemic. This virus differed from the ordinary encephalitis virus principally involved in that epidemic. Injected into mice or monkeys, the new virus gave rise to a fatal lymphocytic infiltration of the choriomeningeal tissues with minor involvement of the lungs. Later an apparently identical virus was isolated by Rivers and Scott<sup>2</sup> from 2 other patients with fatal nonbacterial meningitis and by Findlay, Alcock and Stern<sup>3</sup> from the cerebrospinal fluid of 2 patients who survived. Traub<sup>4</sup> at about the same time demonstrated the existence of an endemic in a colony of apparently normal mice apparently due to the same virus. Evidence that infected house mice are the probable source of the human infection was presented by Armstrong, Wallace and Ross,<sup>5</sup> who recovered the virus from mice trapped in the homes of 5 persons who had the disease. There were no human cases in neighboring mouse free homes or in homes which harbored noninfected mice. Dogs and rhesus monkeys may also serve as natural reservoirs for this disease.

Traub estimates on the results of serologic studies that 50 per cent of all members of a mouse colony may be infected, with a mortality of about 2 per cent. The majority of the naturally infected mice show no

definite symptoms, the presence of the virus being determined by inoculating their blood or brain emulsions into normal guinea pigs. Disease free mice may be infected by placing them in contact with mice which have this subclinical or latent disease. Nearly 100 per cent of all mice from noninfected stock develop recognizable symptoms in from five to twelve days after intracerebral inoculation. As the disease progresses, tremors and spastic convulsions of the hind legs are noted, practically all mice dying in convulsions from one to two days after the onset of recognizable symptoms. At necropsy the brain appears hyperemic. Microscopically the meningeal infiltration is mainly with lymphocytes, with an occasional plasma cell or polymorphonuclear leukocyte. Areas of discoloration and consolidation are seen in the lungs. According to Rivers, this interstitial bronchopneumonia is similar to that caused by other viruses.

The virus is readily identified by specific neutralizing tests with convalescent human serum. By such neutralization tests it has been shown that the virus is excreted in the urine and nasal secretions. The disease is readily transmitted by nasal instillation, by instillation into the urethra or vagina of monkeys,<sup>6</sup> by application of infectious material to slightly scarified skin surfaces, and even to the unscarified skin of guinea pigs.<sup>7</sup> The virus is apparently transmitted through the normal placenta, the majority of the mice of certain colonies being infected in utero. After subcutaneous inoculation the virus may be detected within twenty-four hours in the blood stream, increasing to a maximum by the fifth day. The virus persists in the circulation till the death of the animal or for several weeks or months after convalescence in nonfatal cases. The prompt appearance and persistence of this virus in the blood stream offers almost ideal conditions for its transmission by blood sucking insects.

Major efforts to determine the vector have revolved around the common blood sucking insects. Thus, three years ago Coggeshall<sup>8</sup> announced the successful transmission of the virus from guinea pig to guinea pig through the bite of one species of mosquitoes (*Aedes aegypti*). In his experiments these mosquitoes were capable of transmitting the infection as early as the fourth day after feeding on an infected animal and as late as the fifteenth day. Milzer,<sup>9</sup> however, obtained negative results with two other species of mosquitoes (*Culex pipiens* and *Aedes albopictus*), and with *Aedes aegypti* kept at room temperature. Transmission was readily effected by *Aedes aegypti*, however, between the seventh and the twenty-first day after feeding on an infected guinea pig, provided this species was kept at temperatures varying from 28 to 32 C (82.4 to 89.6 F). In 1 case

a mosquito incubated at the optimum temperature of 30 C (86 F) was able to infect guinea pigs as late as thirty-eight days after feeding on an infected host. These results correspond with those reported by previous investigators on the effects of extrinsic temperature on aegypti transmission of yellow fever and on the development of the sexual cycle of human malarial parasites in *Anopheles*. Milzer concludes from this evidence that, "because of the relatively high temperatures necessary for infection, *Aedes aegypti* would probably not be a vector of any importance" in the natural spread of lymphocytic choriomeningitis.

Milzer also tested the vector potentiality of the rhesus louse (*Eupedicinus longiceps*) and of certain blood sucking mites (*Atricholaelaps glasgowi*). The virus can be demonstrated in lice twenty-four hours after feeding on an infected monkey. Three hundred presumably infected lice, transferred to the back of a normal monkey, however, did not produce a virus infection. The virus survives for at least twenty-five days in blood sucking mites kept at room temperature, but attempts to transmit the disease by the uncontrolled feeding of infected mites also gave negative results. Two mice and 2 guinea pigs were each forced to swallow a gelatin capsule containing 20 living infected mites. All four animals developed typical choriomeningitis on the seventh day after this infected meal.

Somewhat more striking results were obtained with bedbugs (*Cimex lectularius*). Two methods of infection are conceivable with these insects, a direct infection by the mouth parts and an indirect infection through deposit of feces on the skin, bedbugs habitually defecating at the time of biting. Successful transmission to a normal guinea pig was effected in eleven out of eighteen attempts in which fecal contamination was not prevented. Male and female bedbugs as well as first stage larvae gave positive results. Under conditions that exclude fecal contamination, however, the virus may be transmitted by the mouth parts ten minutes after feeding on an infected guinea pig, negative results are obtained twenty-four hours or more after such feeding.

Control experiments showed that the virus is usually present in infectious concentration in dried feces collected from infected bedbugs as late as eighty-five days after an infectious feeding. The feces are obtained by saline washings of test tubes in which the bugs are stored or from strips of sterile filter paper on which the bedbugs have defecated. Such feces are able to infect guinea pigs if applied to the lightly scarified skin. The virus persists in the intestinal tract of bedbugs through molting from the first to the second larval stage but has not yet been detected after the second molting. Hereditary transmission of the virus has not been demonstrated. Eggs hatched under conditions that prevent fecal contamination resulted in virus free larvae. Attempts to transmit the virus by swal-

lowing gelatin capsules containing 5 to 6 infected bedbugs also gave negative results in both mice and guinea pigs. Cage to cage transmission was effected by using bedbug infected cages but gave negative results in bedbug free cages.

This work suggests that the bedbug is the major vector in the natural epidemiology of lymphocytic choriomeningitis, a conclusion which is all the more striking in view of the common belief that "bedbugs have not been definitely incriminated as important natural vectors of any disease"<sup>10</sup>. Furthermore, Milzer's demonstration that mosquito transmission of this disease is possible only under a narrow temperature range suggests the desirability of repeating transmission experiments with poliomyelitis and other viruses under carefully controlled temperature conditions.

#### STUDIES WITH RADIOACTIVE IRON

The suggestion has been made that the production of radioactive isotopes by physicists and the concentration of naturally occurring isotopes by chemists have provided what may in the final analysis prove to be the "Rosetta stone" for the elucidation of metabolic processes of the organism. The isotopes are readily recognizable, tagged elements that apparently behave exactly like their common prototypes in the body. The radioactive isotope of iron, which has the comparatively long half life of forty-seven days, has proved to be a particularly valuable tool in biologic researches, and its use has amplified our understanding of the metabolism of iron. The informative experiments of Hahn and his co-workers on the absorption, transportation and utilization of radioactive iron have been discussed in THE JOURNAL.<sup>1</sup> Studies with tagged iron permitted the surprising observation that the need of the organism for iron in dogs in some manner determines the absorption of this element, absorption being appreciable in anemic dogs but only slight in normal dogs.<sup>2</sup> Hahn and his associates have continued their work with radioactive iron and have made additional contributions to our knowledge of iron metabolism.

Recently, suggestive experiments on the fate of the iron from destroyed red cells were carried out by these investigators.<sup>3</sup> Blood destruction in dogs was produced with acetylphenylhydrazine, and it was found that the iron liberated from the erythrocytes was utilized nearly quantitatively in the regeneration of new red cells during the period of spontaneous recovery.

3 Cruz W. O., Hahn P. F. and Bale W. F. Hemoglobin Radio-Active Iron Liberated by Erythrocyte Destruction (Acetylphenylhydrazine) Promptly Reutilized to Form New Hemoglobin Am. J. Physiol. 135: 595 (Feb) 1942.

from the anemia. Thus the animal organism appears to be highly efficient in conserving the iron of the blood. In studies on normal dogs with an ample reserve supply of iron it was observed, moreover, that the hemoglobin iron of new red blood corpuscles derived largely from the iron of old red cells which are broken down in the normal wear and tear, rather than from reserve stores. When hemoglobin is regenerated in an iron deficient, anemic dog following a single oral administration of the radioactive isotope, the age of the red cells into which the pigment is built can be considered as known to within a few days.<sup>4</sup> On the contrary, when disintegration of erythrocytes occurs either by aging or by trauma, reutilization by new cells of the labeled iron from the liberated hemoglobin is such that the total circulating radioactivity is maintained constant. It is therefore not feasible to use the iron isotope in the determination of the life cycle of the red cell.<sup>5</sup> Further studies with radioactive iron will undoubtedly help to elucidate more fully the metabolic processes in which iron is involved. The employment of radioactive isotopes, including radio iron, in biologic investigations provides another example of the recent contributions of physics to medicine, for it is the cyclotron or the physicist which makes possible the tagging of elements.

### Current Comment

#### MOSQUITOES AND ENCEPHALITIS IN THE YAKIMA VALLEY

In a series of recent studies by Hammon, Reeves and their colleagues<sup>1</sup> much new information has been made available on the transmission of encephalitis in the Yakima Valley. In a four month period during the summer of 1941 over 15,000 living arthropods were collected, frozen and inoculated into laboratory animals for the purpose of isolating the encephalitis virus. Over 12,000 of these were mosquitoes. From *Culex tarsalis* Coquillett three strains of St. Louis encephalitis virus and five strains of western equine encephalomyelitis virus were isolated. Virus was not isolated from other species of mosquitoes. For the isolation of either the western equine or the St. Louis virus intracerebral

inoculation of 5 Swiss mice of a suitable strain was proved by comparative tests to be more satisfactory than intracerebral inoculation of one 200 Gm guinea pig or two 8 to 12 day chick embryos. By means of precipitin tests it was demonstrated that *C. tarsalis* feeds in nature on cows, horses, man, pigs, dogs, chickens (other birds?) and sheep. Since *C. tarsalis* has been shown to be an efficient vector of western equine and St. Louis viruses, this widespread feeding makes it possible for the species to spread the infection among many animals and birds. In the course of these investigations an efficient trap for collecting live mosquitoes was developed. Finally the investigators summarize the evidence against *Culex tarsalis* and conclude that it is the most important vector of western equine and St. Louis encephalitis viruses in the Yakima Valley. Its possible role elsewhere is wisely left to be judged on the basis of local observations.

#### JAUNDICE IN WEST AFRICA NOT DUE TO YELLOW FEVER

The clinical diagnosis of yellow fever is often difficult. For the purposes of histologic diagnosis a routine procedure of frozen and paraffin sections of the liver is followed in the Medical Research Institute at Lagos, Nigeria. Smith<sup>1</sup> now presents notes and reports of microscopic examination of the liver in 14 cases in which an obscure clinical picture and a variety of hepatic changes occurred. In all there was unexplained jaundice. In none of the cases described was it possible to elicit a possible causative factor. The microscopic changes in the liver resembled those of subacute yellow atrophy or necrosis in 6 of the cases. Extensive Councilman necrosis was present in 2 and calcified casts in 2. Smith concludes that there are various conditions which, from the changes brought about in the liver, may cause confusion in the clinical diagnosis of yellow fever. The evidence clearly suggests that there are one or more conditions occurring in these African natives which resemble yellow fever but are not due to the same causative virus.

#### BIBLIOGRAPHY OF AVIATION MEDICINE

The performance of modern combat airplanes has so seriously taxed the physiology of the flight personnel that a new field of study has arisen which, for want of a better term, has been designated "aviation medicine." The literature already has become vast and it cuts across not only medicine itself but many phases of biologic, physical and chemical sciences. Now an extensive bibliography in this field has been collected and classified by Hoff and Fulton.<sup>1</sup> The classification has been carefully devised and the references can be approached satisfactorily either through the table of contents or through the index of subjects. There is also an index of authors. This compilation is invaluable for any one engaged in research in the field of aviation medicine.

### "AEQUANIMITAS" IN SPANISH

Among the classics in American medical writing is "Aequanimitas" by Sir William Osler. As a friendly gesture toward our South American colleagues, Eli Lilly & Company has had a translation of this work made by Dr. Aristides A. Moll, secretary of the Pan American Sanitary Union. A copy of the Spanish edition is being sent on graduation to the graduates of all South American medical schools. A letter which accompanies the presentation expresses the hope that the newly graduated physicians will appreciate and share Sir William Osler's inspiration, his breadth of vision and, above all, his persistent research for truth. The presentation is particularly apropos because this volume contains the magnificent essay entitled "Chauvinism in Medicine," which is a condemnation of all that chauvinism means in inhibiting medical progress.

### FATAL COLLAPSE ASSOCIATED WITH PHYSICAL EXERTION

Acute fatal nontraumatic collapse during indulgence in athletic sport or other strenuous exertion may occur with or without previous signs. An analysis by Jokl and Suzman<sup>1</sup> of Johannesburg of 66 cases of sudden death in which clinical data and complete necropsy reports were available indicates the not unexpected conclusion that collapse associated with exertion is almost invariably due to circulatory disease of long duration. The following conditions arranged in order of frequency were found at necropsy: coronary artery disease, acute coronary occlusion, degenerative disease of the heart muscle, ruptured aneurysm of the aorta, chronic inflammatory disease of the heart muscle, ruptured aneurysm of the cerebral arteries, rupture of the heart, rupture of a congenitally diseased aorta, developmental abnormalities of the heart and developmental hypoplasia of the entire arterial system. They point out that arterial blood pressure rises physiologically during exercise and drops below the initial level during the rest period following exertion. In the cases studied, whenever the necropsy revealed that death had been due to rupture of diseased blood vessels the first symptoms of the collapse preceding death had set in during muscular effort. During the negative phase after exertion, when the arterial pressure drops lower than the initial level, there is distinct danger to those who suffer from coronary and myocardial disease. In this group was a football player who lost consciousness after a game and died thirty minutes later. The authors believe that expiratory effort with a closed glottis represents the greatest physical stress with which the heart has to cope. The diffusion of oxygen through the lung is virtually suspended, and oxygen saturation of the capillary blood consequently decreases rapidly. The ultimate result is a pressure gradient apparently measured, as far as the coronary system is concerned, by the difference in pressure between the aorta and the coronary sinus and right ventricle. In subjects with coronary artery disease and deficient capillary supply of a hypertrophic myocardium, the physiologic phase often represents a catastrophic event from which the

heart may never recover. The authors discuss a gastrocoronary reflex often present in strenuous exertion involving rise of intragastric pressure probably in the proximal portion of the stomach which, it is claimed, elicits a reflex constriction of the coronary artery circulation. They conclude from this and other work that any functional strain conceivable cannot cause fatal collapse but that certain diseases such as those enumerated render the heart and blood vessels so vulnerable that the physiologic effort associated with physical exertion may overtax their adaptive plasticity.

### CHEST INJURY AND CORONARY OCCLUSION

The question as to whether or not direct nonpenetrating injury of the chest can damage the heart or produce acute coronary thrombosis has received comparatively little study.<sup>1</sup> In a recent examination of this subject Lennoff<sup>2</sup> presents 17 cases involving trauma to the chest followed by symptoms of acute cardiac damage. The injury was considered an important etiologic factor in the first 15 cases and only incidental in the last 2. The clinical picture in these cases is that of an acute pathologic condition of the heart closely resembling coronary occlusion, from which, however, it may be differentiated by the history of trauma. The history is the most important single factor in determining the causal relation and the subsequent degree of disability. Electrocardiographic changes, however, are definite and important and usually show changes associated with acute cardiac lesions. Lennoff concludes that direct nonpenetrating injury of the chest can produce nonfatal disabling heart damage and that the resulting characteristic clinical syndrome should be considered in the presence of any injury of the chest.

### MENTAL CONFUSION FROM THE SULFONAMIDES

THE JOURNAL previously has called attention editorially to the danger of impaired judgment which sometimes results from sulfanilamide administration.<sup>1</sup> Now the Committee on Disability and Rehabilitation of the Medical and Surgical Section of the Association of American Railroads<sup>2</sup> reemphasizes this hazard. Investigation reveals, this report states, that there is frequently a period of confusion following administration of any of the sulfonamide group of drugs. Hence it is recommended that a patient, after receiving treatment of this type, should be free from work for seven to fourteen days following such administration before being permitted to resume duties in either engine or train service. The possibility of serious mental confusion must be borne in mind especially for those whose activities under circumstances of impaired judgment would be particularly hazardous to others. This would include many occupations in civil life and practically all those in military fields.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## PROCUREMENT AND ASSIGNMENT SERVICE FOR PHYSICIANS, DENTISTS AND VETERINARIANS

### PRESENT STATUS OF PROVISION AND SUPPLY OF PHYSICIANS

Frank H. Lahey, Chairman  
For the Directing Board

Many thousands of medical officers have taken their oaths of office or are now in the process of being commissioned in the Army and Navy. Additional thousands of physicians under 37 years of age have been cleared by the professional and state committees for service in the Army and Navy. In some states, quotas developed by the Procurement and Assignment Service have been filled. However, with the rapid expansion of the armed forces planned during the next six months and with the growth of the military medical services, many additional thousands of medical officers will be required.

Some reduction in the number of medical officers per thousand troops is anticipated because the Army has changed its tables of organization, so that officers in the Medical Administrative Corps will be assigned to administrative positions formerly held by medically trained men.

#### ENROLLMENT

By June 1 a hundred and thirty thousand enrollment forms and questionnaires had been returned by physicians. Although many thousands indicated that a commission in the armed forces was their first choice, relatively few applications for commissions in the medical corps of the several services had been received. This seems to have been due to a misunderstanding, namely, that enrollment with the Procurement and Assignment Service was equivalent to applying for a commission. Furthermore, lack of personnel and equipment delayed entering the data of the questionnaires on punch cards. All the information has now been coded on the punch cards. Obviously, every physician should enroll with the Procurement and Assignment Service. If the physician is enrolled, he will be benefited by receiving proper consideration from his Selective Service board, and the state chairman of the Procurement and Assignment Service will be aided in arriving at a decision as to occupational deferment and in rating a physician or dentist as available or essential.

All physicians who failed to enroll and file questionnaires are now being listed. This will be done with the aid of the National Roster and of the American Medical Association. If you have not yet filled out an enrollment form and questionnaire, you should, for your own benefit if not for proper service to your nation, fill out the enrollment form and questionnaire at once. If you do not have a blank form, request one immediately from the National Roster of Scientific and Specialized Personnel, 1006 U Street NW, Washington, D. C.

#### THE RECRUITMENT OF PHYSICIANS

On April 18 the President issued an executive order transferring the functions of the Procurement and Assignment Service to the War Manpower Commission in the Office for Emergency Management. Previous to this the Navy established offices of Naval Officer Procurement in all naval districts throughout the United States for the most rapid processing of applications and the procurement of officers.

During the latter half of May, terms of army officers constituting medical officer recruiting boards were sent by the War Department to various states to stimulate and facilitate the

recruiting of medical and dental officers for the Army. These boards are authorized to issue commissions to qualified applicants immediately. The weekly number of appointments rose sharply. Since the members of the recruiting boards are getting in contact only with those physicians and dentists who have been "cleared" by the Procurement and Assignment Service, there has been a greatly increased volume of work in this agency. To handle this additional work, the office personnel of the Procurement and Assignment Service was increased, and on July 2 its offices were moved to 1006 U Street, NW, along with those of other divisions of the War Manpower Commission, including the National Roster of Scientific and Specialized Personnel.

With these increased facilities, proper functioning became possible. By the middle of July letters had been forwarded to fifteen hundred physicians under 37 years of age who had signified their preference to serve with the Army. Each letter contained a postcard addressed to the Surgeon General of the Army and one addressed to the War Manpower Commission, and the physician was asked to sign and forward them, thus indicating his desire to be commissioned. The sending of these letters will be continued. To expedite matters, the recruiting unit in each state is informed by the Office of the Surgeon General of the applicant's willingness to apply for a commission.

The Navy Department is furnished names by the Procurement and Assignment Service of those physicians who signify a preference for the Navy. The Bureau of Medicine and Surgery sends such physicians invitations to enroll in the Medical Corps of the United States Naval Reserve and indicates to them how they may apply according to Navy regulations. Physicians should realize that they still have freedom of choice as to the armed service to which they prefer to apply for commission. It is to be borne in mind that the Selective Service boards alone have the legal authority to draft physicians. These boards have been instructed to give every consideration to the physicians whose numbers have been called.

Thus the Procurement and Assignment Service is now functioning according to the plans originally established by the directing board and by the various committees. Its purpose, however, includes not only the listing and procurement of medical, dental and veterinary personnel for the armed forces but also the procurement and equitable allocation of medical and allied personnel for civilian service in medical schools, hospitals, industry, nonmilitary governmental agencies and civilian communities.

#### NEEDS OF THE CIVILIAN POPULATION

One of the first steps taken by the directing board of the Procurement and Assignment Service was the establishment of a study of the distribution of physicians in each of the states according to age, sex and type of practice, in relation to population. These data were utilized in meeting the needs of the armed forces, due allowance being made for the differences between states. Furthermore, the medical needs of districts in each state were roughly estimated, on the basis of one physician for each 1,500 of population. These figures are

employed in determining the number of physicians to be judged "essential" in any given area. The status of individual physicians, not only in private practice, but also in hospitals, medical schools, industry and various governmental institutions, was determined only after the local authorities had been consulted, and the final decision was always left to the state committees or, in the case of dispute, to the corps area committees.

Unfortunate incidents have arisen through the commissioning of men previously declared "available" who have suddenly become "essential" because of the death, disability or enlistment of some other physician. In such cases nothing can be done by the Procurement and Assignment Service if the oath of office has been administered. However, the Navy has revoked the commissions in instances in which the withdrawal of a physician from his community was not obviously to the best interests of the general defense program. Many difficult situations have been created by the volunteering of men listed as "essential." Such a physician is just as important to the war effort as a medical officer, he should not apply for a commission unless he is certain that some one is available to take his place. In fact, in this country, as in England, the armed forces have agreed to refuse a commission to a physician or dentist so designated. The Navy likewise is doing this.

#### RESERVE OFFICERS

All reserve officers of the Army are now subject to call to active duty even though they have been declared "essential", such men were granted permission to resign prior to July 1,

1942. All reserve officers of the Navy, except interns, are placed on active duty within a month after obtaining their commissions.

#### MEDICAL SERVICES FOR INDUSTRIAL COMMUNITIES

Medical services must be provided for new or rapidly expanding industrial communities. This is essentially a local problem, but, if physicians are not available, men who are physically unfit or too old for military service, and who are willing to be dislocated, must be assigned to such positions. This is a problem to which the directing board of the Procurement and Assignment Service is now giving special consideration so that suitable recommendations may be sent to the War Manpower Commission.

#### ADDITIONAL PROBLEMS

1. A suitable pool of physicians, including specialists, must be established from which the armed forces can draw for men with general and special training and for future needs.

2. The headquarters of Procurement and Assignment Service, now well organized and located with the National Roster of Scientific and Specialized Personnel at 1006 U Street N.W., Washington, D.C. proposes to maintain up to date information concerning each physician, dentist and veterinarian in the United States, his assignment and his availability.

3. Consideration is being given to the utilization of the physicians who have graduated from unapproved medical schools and of citizens of co-belligerent countries, of enemy countries and of enemy occupied countries.

#### NUTGALLS AND TANNIC ACID U S P

Because the fulfillment of requirements for the defense of the United States has created a shortage in the supply of nutgalls and tannic acid U S P, order M-204 has been issued by the War Production Board to establish control of these agents. Nutgalls are defined as the excrescences or galls obtained from the young twigs of *Quercus infectoria* Olivier and other allied species of *Quercus* (Fam. Fagaceae) or from the leaves of *Rhus semialata* Murray or *R. javanica* L., tannic acid U S P as gallotannic acid or so-called tannin meeting U S P requirements.

Essentially the general restrictions provide that no person shall process, combine with other materials or use any nutgalls except for the maximum production of tannic acid U S P or use any tannic acid U S P except for the treatment of burns or for the manufacture of a product to be used exclusively for the treatment of burns or as an analytic agent for use in analytic control in research laboratories or as an antidote for internal administration in the treatment of poisoning or in the extemporaneous compounding by licensed pharmacists of individual prescriptions of licensed physicians, dentists or veterinarians or in the extemporaneous compounding of medicines by licensed physicians, dentists or veterinarians for their own patients. No person shall sell, transfer or deliver or purchase or accept transfer or delivery of any nutgalls or tannic acid U S P which he knows, or has reason to believe, is to be processed, combined with other materials or used for purposes other than those permitted by the preceding exemptions. Further purchasers must sign a certification that nutgalls or the acid will be used only for permitted purposes. The restrictions will not apply to any stock of nutgalls amounting to less than 5 pounds, nor will it apply to nutgalls or tannic acid U S P which has been combined with any other material before issuance of the order. It will not apply to the householder who uses the U S P acid for his own medicinal purposes, but the person who sells to the householder must observe the prescribed restrictions.

All persons possessing or having control of stocks of nutgalls amounting to 5 pounds or more at any one place or of tannic acid U S P amounting to 2 pounds or more must file a report with the War Production Board on form PD-623 before Aug. 31, 1942. Any person affected by this order who considers that compliance therewith would work an exceptional or unreasonable hardship on him may appeal to the War Production Board. All reports and communications concerning

this order should be addressed to War Production Board, Health Supplies Branch, Washington, D.C., reference M-204. Wilful violation of the order may result in punishment by fine or imprisonment, in addition to that individual being prohibited from making or obtaining further deliveries.

A recent release from the Office of War Information, War Production Board, asserts that Health Supplies Branch officials believe that there are adequate substitutes including tannic acid technical grade, available for the industrial and medicinal purposes for which tannic acid U S P is now prohibited. Nutgalls, which develop on certain species of shrubs, are normally obtained from China, Turkey, Syria, Iran and Iraq. Obviously, only comparatively small amounts now can be expected from these sources. Although there are other possible raw material sources of tannic acid such as tara, sumac, divi-divi and other shrubs found in the Western Hemisphere, it is not believed that any substantial amounts of tannic acid meeting U S P requirements can be obtained from such sources at this time. Order M-204 is expected to conserve approximately half the former civilian consumption of the U S P acid.

#### SURVEY OF NEW JERSEY HOSPITAL FACILITIES FOR EMERGENCIES

The Office of Civilian Defense director of the state of New Jersey has surveyed the public hospitals in the state which are available for emergency services. Of these there are eighty-nine general hospitals with a total emergency bed capacity of about 20,000; nine state and county mental disease hospitals with 16,000 beds; fourteen state and county tuberculosis sanatoriums with 4,300 beds; eight county and local isolation hospitals with 1,500 beds; and a veterans hospital for mental patients with 1,750 beds. Additional hospitals which might be considered available for emergency services are the proprietary hospitals and the nursing and convalescent homes.

The state hospital officer has classified the public hospitals with regard to vulnerability into four classes. 1. Maximum vulnerability. Use as casualty hospital only. These hospitals are in metropolitan centers or serve key defense areas likely to become objectives of attack. 2. High vulnerability. Use as casualty hospital only. These are hospitals in suburban and some urban communities offering slightly less significance as military objectives than those served by class 1 hospitals. 3. Low vulnerability. Use as emergency base hospital. These

are hospitals in rural or semirural areas where the probability of attack is relatively unlikely. 4. Minimum vulnerability. Use is emergency base hospital. These are hospitals in rural and protected areas believed to offer the greatest relative safety as emergency base hospitals possible within the state.

The Office of Civilian Defense director of New Jersey states that of the general hospitals thirty-three are in areas of maximum vulnerability, thirty-eight in areas of high vulnerability and nine each in areas of low and minimum vulnerability, respectively. According to the present plans of federal authorities there would be two types of hospitals, functioning in the emergency: (1) casualty receiving hospitals, which would care for casualties occurring near the area in which the hospital is located, and (2) emergency base hospitals located in rural and safe areas to which patients needing prolonged hospital care would be evacuated. The emergency base hospitals will include existing new or improvised facilities. All hospitals in the nation, voluntary or governmental, may serve as casualty hospitals of the Emergency Medical Services established by the Office of Civilian Defense for the care of civilian casualties caused by enemy action. This plan will not affect the management or control of such hospitals. Cash payments will be given to them for caring for casualties pursuant to the President's order at a rate of \$175 a day.

The State Hospital Officer and the Emergency Medical Service are responsible for determining in collaboration with the local military and state evacuation hospitals, the plans of evacuation and means of transport of civilian casualties from local casualty receiving hospitals to emergency base hospitals. Evacuation plans must be coordinated with plans made for the evacuation of the general population and with the restrictions placed on the use of highways, making necessary the routing of casualties over secondary highways.

Central administrative units (control centers) are being organized to cover the various districts in New Jersey in order to integrate the activities of the various protective services, including hospital services. The district control center will direct rescue squads and emergency medical field units to the scene of the incident. Following emergency care at the scene, casualties will be dispatched to hospitals designated by the control center. When all the hospitals within a district are full of patients, the district control center will notify the main control center, which will direct that additional casualties be routed to public hospitals in some other district.

Emergency base hospitals may require a large staff of physicians and dentists, and since a well balanced technical staff cannot be assembled hurriedly, according to the Office of Civilian Defense director, it is proposed to expand the commissioned reserve of the United States Public Health Service for this purpose. Recruiting will be carried on in collaboration with the Procurement and Assignment Service largely from the older age groups, from physicians with minor physical disabilities which make them ineligible for military service, and from women physicians. The U. S. Public Health Service and the Medical Division of the Office of Civilian Defense will cooperate with the American Red Cross, responsible state and local officials and other organizations in arranging for nursing, technical and other services in emergency base hospitals.

### GRADUATION AT CARLISLE BARRACKS

Another field training course at the Medical Field Service School, Carlisle Barracks, Pa., was completed on July 1 with the graduation of one hundred and seventy-nine officers of the medical department, representing thirty-four states. The subjects taught included field medicine, military sanitation, military art, logistics, administration and training. The graduation ceremony was held in the War Department theater and the diplomas were presented by Brig. Gen. Addison D. Davis, commandant of the school. These classes are designed to give graduates in medicine, dentistry and veterinary medicine training for military duties in the field. After the ceremony the graduates left immediately to join their units. The class comprised one hundred and ten medical corps officers, sixty-one of the dental corps, four of the veterinary corps, two of the sanitary corps and two of the medical administrative corps.

### FEDERAL AID FOR SCHOOLS OF NURSING

Schools of nursing have been asked to admit 55,000 students during the current school year, which is an increase of 10,000 over last year's admissions.

An appropriation of \$3,500,000 has been made by the Congress for the training for nurses (national defense). The schools of nursing throughout the country have been notified regarding the availability of these funds, and the schools are urged to participate in this program.

Funds are allotted by the Public Health Service directly to eligible schools. Schools unable to increase their admissions over the school year 1940-1941 may request scholarship tuitions for qualified students. The goal is that no qualified student be barred from entering a school of nursing because of lack of funds. Funds are available for students unable to meet costs from other sources.

Schools that are able to increase their admissions over the school year 1940-1941 may request funds for scholarship tuitions and in addition for the following purposes:

1. Additional instructors and instructional facilities commensurate with increased student admissions.

2. Subsistence during that portion of the program when the student is not rendering any appreciable service to the institution.

3. Expansion of clinical experience through affiliation with other institutions.

A previous announcement outlined the objectives of the program and the purposes for which these funds might be used.

For further information, schools may write to the U. S. Public Health Service, Washington, D. C., Bethesda Station.

### NUTRITION ADVISORY SERVICE ORGANIZED

An industrial nutrition advisory service has been organized under the direction of Dr. W. H. Sebrell Jr., director, division of chemotherapy, U. S. Public Health Service, and M. L. Wilson, assistant administrator, Office of Defense Health and Welfare Services. The new service will provide practical recommendations to both government owned plants and private industries to meet specific industrial nutrition problems which may affect production increasing absences and accidents. Dr. Robert S. Goodhart, New York, recently appointed a member of the U. S. Public Health Service, will direct the nutrition advisory service to industry. Assisting Dr. Sebrell and Dr. Goodhart will be Dr. Mark Graubard, biochemist, formerly on the staff of Columbia University, and Ernestine Perry, formerly of Springfield, Mass. The entire project is directed toward reducing the twenty-four million man hours lost monthly on the production fronts, and the entire program will move forward on three fronts: industry, homes and communities.

### MEDICAL SUPPLIES ARRIVE SAFELY IN CHINA

Dr. Robert B. McClure, who left New York City last November, has arrived safe in Kweiyang, China, with a consignment of cases containing medical supplies furnished by the Medical and Surgical Relief Committee of America, 420 Lexington Avenue, New York. Another physician, Dr. Dietrich V. Wiebe, of Reedley, Calif., has left more recently with additional medical and dental supplies for service in China, with an ambulance unit sent there by the American Friends Service.

### ARMY PERSONALS

Dr. Pashnpati J. Sarma, formerly associate professor of surgery at the University of Illinois College of Medicine, Chicago, is reported to have been promoted to the rank of colonel in the Army while serving at Camp Barkley, Texas.

Col. Raymond F. Metcalfe, M. C., U. S. Army, retired, until recently on duty at the San Francisco Port of Embarkation, has been ordered to duty in Washington, D. C., and will be succeeded at the Port of Embarkation by Col. Wallace DeWitt, U. S. Army, retired.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH)

### CALIFORNIA

**Institutes on Wartime Industrial Health**—The California State Department of Public Health is conducting a series of institutes on wartime industrial health in cooperation with the California Medical Association and the Western Association of Industrial Physicians and Surgeons. The institutes opened on August 18 in San Francisco and were held in Crockett August 19 and Oakland August 21. They will be held in San Diego on August 25, Inglewood August 26, Glendale August 27 and Huntington Park August 28. Out of state speakers include Dr. Carey P. McCord, Detroit, "The Conservation of Industry's Manpower" and J. J. Bloomfield, Bethesda, Md., "Industrial Hygiene in War Production".

**Dr. Wilbur to Continue as Head of Stanford University**—Dr. Ray Lyman Wilbur, president of Stanford University since 1916, will continue to head the university through the academic year ending August 1943, because of the war emergency. According to an announcement from the school, this is the third time since he reached the retirement age in 1940 that he has consented to continue to direct the university. Recently, to honor him for his long service to the university, the title of chancellor was conferred on him. During a dinner to commemorate this event given by the alumni of Stanford University School of Medicine, San Francisco, a life size portrait of Dr. Wilbur was unveiled, the work of Josef Sigall.

### DISTRICT OF COLUMBIA

**Experimental Rate Plan Adopted at Gallinger Hospital**—The district commissioners have approved a formula for charges to be levied against patients admitted to Gallinger Municipal Hospital. The formulas are to be graded according to the patient's income and dependents. The plan will be carried out for a sixty day experimental period beginning at once, the *Washington Star* reported, July 31. The plan provides that no person shall be eligible to receive medical care at the expense of the district if he has an interest in real property with an assessed valuation of \$2,500 or more or if he has real or personal property of \$250 or more. Patients will be required to sign promissory notes to cover the cost of hospitalization. It was stated. The adopted formula sets up three categories: one is for Gallinger patients who are indigent to a degree not warranting hospitalization charges, the second is for the partially indigent, prescribing charges ranging from 50 cents to \$3.50 a day, and the third is for persons deemed in a position to warrant a full charge, which is \$4 a day.

### ILLINOIS

**Health Advisory Committee Appointed**—On July 21 Governor Green appointed a special state health advisory committee, consisting of thirty-one members to serve in an advisory capacity to the state division of maternal and child hygiene according to the *Chicago Sun*. Dr. Frederick H. Falls, Chicago professor and head of the department of obstetrics and gynecology, University of Illinois College of Medicine, is chairman of the new committee, and Drs. Roland R. Cross, Springfield state health director and Fred L. Adair, chief of the state division of maternal and child hygiene are ex officio members. The committee will give advice on wartime problems in protection of the health of mothers, expectant mothers, infants and children.

#### Chicago

**License Revoked for Association with Abortionist**—The Illinois State Department of Registration and Education on June 6 revoked the license to practice medicine of Dr. Josephine Gabler. The action was taken after an expose of an abortion racket in the city in which her name had been mentioned. Newspapers reported that the physician was charged with being associated with and lending the use of her name to Mrs. Ada Martin, who stood trial for conspiracy to commit abortions. Newspapers also reported that Dr. Gabler admitted that she sold her loop medical practice to Mrs. Martin and further that both Mrs. Martin and her daughter were her employees prior to the sale of the practice, but she maintained

she knew nothing about Mrs. Martin heading an abortion ring. It was also stated that the investigation of the abortion ring resulted in two suicides, a murder and a "shakeup" in the state's attorney's office. Dr. Gabler graduated at Dearborn Medical College in 1905 and was licensed to practice in Illinois in the same year.

### INDIANA

**Changes in Health Officers**—Dr. Roy H. Elliott, Connersville, has been appointed health officer of Fayette County to succeed the late Dr. John S. Leffel, Connersville.—Dr. Floyd L. Burris is the new health officer of Michigan City, succeeding Dr. Norman R. Carlson, who is with the U. S. Army Air Corps at Hill Field, Ogden, Utah.—Dr. Frank A. Beardsley, Frankfort, has been appointed health officer of Clinton County to succeed Dr. Bruce A. Work, Frankfort, who is in the Army.

### IOWA

**Psychologist Named to Direct Child Welfare Station**—Robert R. Sears, Ph.D., formerly research assistant at the Institute of Human Relations, Yale University, New Haven, has been appointed head of the Iowa Child Welfare Research Station, Iowa City. Dr. Sears received his degree in doctor of philosophy at Yale in 1932 and has served on the staffs of the University of Illinois Institute of Juvenile Research, Chicago, and Wesleyan University, Middletown, Conn. Dr. Sears succeeds George D. Stoddard, Ph.D., who became New York State commissioner of education on July 1 and who is a member of the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association. The child welfare research station is part of the State University of Iowa College of Medicine.

### KANSAS

**Personal**—Drs. Floyd C. Taggart, Paul E. Belknap, Milton B. Miller and William C. Menninger were elected members of the Topeka Board of Health recently.—Dr. Herman P. Daniels, Wichita, observed the completion of fifty years in the practice of medicine recently.

**Society News**—Dr. Joseph W. Kelso, Oklahoma City, among others, addressed the Southeast Kansas Medical Society in Neodesha, June 25, on "Cancer of the Cervix".—The Golden-Belt Medical Society was addressed in Manhattan, July 9, among others by Dr. Frank A. Krusen, Rochester, Minn., on physical therapy.

**State Society Appoints New Committees**—The Kansas Medical Society has announced the creation of three new committees: the committee on the control of appendicitis with Dr. Harry Lutz, Augusta, chairman; the committee on conservation of hearing with Dr. Lyle S. Powell, Lawrence, chairman; and the committee on plasma, of which Dr. Warren F. Bernstorf, Winfield, is chairman.

### LOUISIANA

**Tulane Professors Visit Venezuela**—Three members of the faculty of Tulane University of Louisiana School of Medicine, New Orleans, left on July 4 for a tour of hospitals and medical schools in Venezuela. The three physicians are Drs. Hiram W. Kostmayer, acting dean of the medical school, E. W. Alton Ochsner, William Henderson, professor of surgery, and William A. Sodeman, assistant professor of medicine. They will make a study under the direction of Dr. Alfred Gage, associate director of the medical department of the Standard Oil Company. One object of the trip will be to complete plans for the oil company to send two Venezuelan students to Tulane each year for medical and premedical work, according to the *New Orleans Times Picayune*.

### MINNESOTA

**Kenny Unit to Be Set Up in Public Health Center**—Plans are under way to establish clinics and hospitalization for the treatment of anterior poliomyelitis and its resultant paralysis at the Public Health Center, Minneapolis, formerly known as the Lymanhurst Health Center. The clinics would be under the direction of Sister Elizabeth Kenny, who has been in Minneapolis for some time directing work of this kind. If the program goes through, the hospital element of the center will be transferred to the Minneapolis General Hospital. The Public Health Center houses a 40 bed hospital for the study and treatment of incipient and rheumatic heart disease in children; outpatient clinics for tuberculosis control in adults and children; a cardiac school clinic and a venereal disease control clinic, all of which services are conducted by the division of public health.

## NEW HAMPSHIRE

**Dr Frechette Appointed Secretary of Health Board**—Dr Alfred I. Frechette, formerly director of the division of venereal disease control of the New Hampshire State Board of Health, Concord, has been appointed secretary and executive officer of the board. He succeeds Dr Travis P. Burroughs who resigned to accept a commission as surgeon in the U S Public Health Service Reserve. Dr Frechette graduated at the University of Vermont College of Medicine, Burlington in 1934 and at the Harvard School of Public Health in 1939.

## NEW JERSEY

**Ill Award Goes to Dr E Zeh Hawkes**—The third Edward I. Ill Award was recently presented to Dr E. Zeh Hawkes, Newark, formerly president of the Medical Society of New Jersey. The award was established by the Academy of Medicine of Northern New Jersey in honor of the late Dr Edward I. Ill who was the academy's first president. Dr Hawkes was born in Schenectady, N. Y., in 1865. He graduated at Columbia University College of Physicians and Surgeons in 1890. Later serving on the staffs of the Newark Hospital, St. James Hospital of Newark and Presbyterian Hospital where he is now medical director. Dr Hawkes, who received the award for his leadership in the development of medical activities in Newark, once served as president of the Medical Society of Essex County and the Academy of Medicine of Northern New Jersey.

## NEW YORK

**Personal**—Dr Charles I. Martin has resigned as medical director of the Albany Hospital to accept a similar position with the Bell Telephone Laboratories in New York City, succeeding Dr Melville H. Manson who has been appointed medical director of the New York Telephone Company's metropolitan area.

**Postgraduate Lectures**—Two lectures will be given at the New York Hospital, White Plains, September 9 and November 11 under the auspices of the subcommittee on maternal welfare of the Medical Society of the State of New York for the Westchester County Medical Society. The speakers will be Drs Mervin V. Armstrong, Brooklyn, on 'Hemorrhage in the Last Trimester of Pregnancy' and Harvey B. Matthews, Brooklyn, 'Heart Disease Complicated by Pregnancy'.

## New York City

**Dr Rice Appointed Deputy to Health Department**—Dr John L. Rice, who resigned recently as city health commissioner, has been appointed a deputy health commissioner. Dr Rice retired as city health commissioner on account of ill health.

**Changes at Cornell**—Included among the recent changes at Cornell University Medical College are the following: Drs Nelson W. Cornell, Guilford S. Dudley and Arthur Palmer to associate professors of clinical surgery; Dr Ade T. Milhorat to associate professor of medicine; Drs Philip M. Stimson and May G. Wilson, associate professors of clinical pediatrics. Assistant professors are Drs Edwin T. Hauser and Henry S. Dunning, clinical medicine; John H. Eekel, clinical surgery; George Burroughs Mider, pathology; and Charles O. Warren, anatomy. Dr John M. McLean has been named associate professor of clinical surgery (ophthalmology).

## PENNSYLVANIA

**Personal**—Dr Meyer K. Amdur has resigned as chief of the reconstruction service, Veterans Administration Facility, Coatesville, to become assistant superintendent at the Longview State Hospital, Cinnemat. Dr Edgar S. Buyers, Norristown, was recently guest of honor at a dinner given by the Bucks County Medical Society in Doylestown in recognition of his thirteen years' service as councilor for the second district of the state medical society.

## Philadelphia

**Dr Macfarlane Appointed Research Professor**—Dr Catharine Macfarlane, professor of gynecology, has been made research professor of gynecology at Woman's Medical College of Pennsylvania in recognition of her work in cancer research at the college. According to the *News Letter* of the Woman's Medical College, Dr Margaret C. Sturgis has been appointed professor of gynecology. Both physicians are graduates of the medical school.

**Memorial Fund to Dr Martha Tracy**—The establishment of a fund to be known as the Martha Tracy Preventive Medicine Memorial Fund was announced in the *Medical Woman's Journal* for July. To be used for the care of women medical students, the fund will honor the late Dr Tracy, who at the time of her death was assistant director of public health. Formerly she had served for many years as dean of the Woman's Medical College of Pennsylvania. The *Medical Woman's Journal* is the official publication of the American Medical Women's Association, of whose scholarship awards committee Dr Tracy served as chairman.

## SOUTH CAROLINA

**Assistant Secretary Appointed**—Dr Julius Howard Stokes, Florence, has been appointed assistant secretary of the South Carolina Medical Association.

**University Physicians Appointed**—Drs Foster M. Routh, Columbia, and Kathleen A. Riley, Florence, have been elected to serve as physicians for the University of South Carolina, Columbia, during the absence of Dr Edward H. Law, Columbia, who is on leave of absence with the Army. Dr Routh will serve as physician to men and Dr Riley as physician to women. In addition they will teach classes in the department of hygiene.

**Changes in Health Officers**—Dr James C. Brabham, Laurens, has been appointed in charge of the district health unit covering Laurens, Spartanburg, Cherokee, Union, Chester, Lancaster, Chesterfield, York, Kershaw, Fairfield and Newberry counties. Dr George E. Parkhurst, Charleston, assistant surgeon, U S Public Health Service, has been assigned as director of the venereal disease program of the Charleston County health department. G. G. Caughman, Ph G, has been chosen health officer of Columbia.

## TEXAS

**Physician's Will Establishes Memorial Fund at Baylor**—The Clarence M. Grigsby Memorial Fund will be established at Baylor University College of Medicine, Dallas, under a bequest mentioned in the will of the late Dr Grigsby. The fund will be derived from the sale of his home and furniture; the proceeds to go to the Southwestern Medical Foundation to establish a fund which will be used for the purchase of medical literature at the medical school.

**Memorial Shaft Honors Country Physician**—On June 10 hundreds of former patients and friends of the late Dr William J. Sparks, Poolville, gathered to dedicate a granite memorial shaft to him. The shaft is placed in the square of the town of Poolville under the sponsorship of the school trustees and was given by Orville Bullington, an attorney of Wichita Falls, as an expression of the appreciation for aid and counsel given him and other youths reared in the Poolville community; newspapers reported Dr Roy H. Gough, Fort Worth, representing the state medical association, gave the dedicatory address.

## VIRGINIA

**Changes in Health Personnel**—Dr Edward M. Holmes, Jr., for several years director of the division of venereal disease control of the state department of health, has been assigned as venereal disease control officer at Randolph Field, Texas. Dr Wallace E. Baker, Petersburg, assistant to Dr Holmes, has been named acting director of the division of venereal disease control for the duration. Dr Hubert D. Crow has been appointed director of a combined district health unit comprising the counties of Southampton, Isle of Wight, Nansemond and the city of Suffolk, with headquarters in Suffolk.

**State Commissioner of Mental Hygiene Appointed**—Dr Hugh C. Henry, Richmond, director of state hospitals, has been appointed commissioner of mental hygiene and hospitals, a newly created position provided in the state government reorganization act, effective July 1. According to the *Norfolk Pilot* the reorganization act establishes a department of mental hygiene and hospitals with the commissioner as principal executive officer, making him subject to reappointment by the governor instead of by the board as is now the case. Dr Henry graduated at the Medical College of Virginia, Richmond, in 1896. He was assistant physician at the Central State Hospital until 1924, when he became superintendent. The hospital is one of six state mental hospitals which Dr Henry supervises. He has been director of state hospitals since July 1, 1938, when the post was created.

## GENERAL

**Meeting Canceled**—The annual meeting of the American Association of Railway Surgeons, which was scheduled to be held in Chicago, September 10-12, has been canceled and all such future meetings postponed for the duration of the war.

**Motion Picture on Back Siphonage**—The Plumbing and Heating Industries Bureau has prepared a motion picture illustrating the dangers to health of faulty plumbing using a story based on a lawsuit. The picture shows clearly that disease may result from the drinking of polluted water caused by back siphonage of plumbing fixtures. The motion picture is available for showing before medical students, medical societies and county health officers. Those desiring to borrow this film may communicate with Mr. Norman J. Ridder, Plumbing and Heating Industries Bureau, 35 East Wacker Drive, Chicago.

**Blood Procurement Project Expanded**—The American Red Cross has announced that the expansion of its blood procurement project has been requested by the surgeon generals of the Army and Navy from the original 900,000 donors during the current fiscal year to a minimum of 2,500,000. This increase will require approximately 50,000 volunteer donations a week. In addition to dried plasma, blood collected is to be processed into human serum albumin, also used for transfusions. Serum albumin as a blood substitute is a recent development and as is the case with powdered plasma, blood used in preparing serum albumin must be shipped in refrigerated containers and must be in the laboratory within twenty-four hours after being drawn. Serum albumin when prepared for shipment is in solution. Nothing need be added before the transfusion is given. A unit of the serum consists of 25 Gm. of albumin dissolved in 100 cc. of isotonic solution of sodium chloride. According to present indications, serum albumin will last for years without deterioration. It does not require refrigeration and can be kept at temperatures ranging from slightly above freezing to approximately as high as 120° F.

**"Pathologist" Passes Bad Checks**—Physicians are being warned of one Morris L. Weiss, who has been seeking employment as a pathologist and laboratory technician but who has been using his credentials to pass worthless checks and otherwise obtain money from innocent persons. The most recent venture of Weiss comes in a report from Dr. Edward J. McCormick, Toledo, Ohio, who is chief of staff of St. Vincent's Hospital, where Weiss was employed for probably three or four weeks, during which time he borrowed money from several doctors, sold books to interns and a blood pressure apparatus to one young physician, and left a large bill at the Willard Hotel and an unfinished financial transaction at the finance company concerning an automobile. He claims to have majored in bacteriology and to have received a Ph.D. degree from the University of Vienna in 1928. He also claims to do all routine laboratory tests, tissue work and research. The chief of police in the city of Brockton, Mass., on July 8, reporting a bad check passed by Weiss, described him as follows: 51 years of age, 5 feet 6 inches in height, black hair with a tendency toward baldness, and weight about 200 pounds. Other letters indicated that Weiss had been active in Nashua, N. H. and Gloucester, Mass.

**Nutrition Values of Canned Foods Study**—A research program for the study of nutrition values of canned foods has been inaugurated with grants by the National Canners Association and the Can Manufacturers Institute with supplementary grants from the University of Wisconsin, Madison. The first phase of the program will cover the assay of about twenty-five products including fruits, vegetables and seafoods for six vitamin factors which are regarded as being of established importance in nutrition, namely: A, C, thiamine, riboflavin, niacin and pantothenic acid. Assays for the vitamins will be made at three universities prominently identified with advances of knowledge in nutrition. Mineral analyses will be made in laboratories connected with the canning industry. In addition to the vitamin and mineral analyses, support will be given to other studies to be conducted in two other universities. According to an announcement, it is desired to determine the effect of storage on vitamin content of representative products and to make a series of correlation tests which will compare the results from methods used for assays and those from standard feeding tests. Other investigations will pertain to the distribution of vitamins as between solids and liquid content and the changes that may result from the preparation of foods for the table. The program is directly aligned with the principles for research which arose from the President's conference on

nutrition in 1941. It was developed by an executive committee consisting of representatives of nationally related firms and was projected with the assistance of authorities in both the canning industry and the nutrition field. An advisory committee representing the canning industry has been named, and it is expected that within the near future a scientific advisory group will be appointed.

**American College of Surgeons**—The 1942 Clinical Congress of the American College of Surgeons, originally scheduled for October at the Stevens Hotel, Chicago, which was taken over on August 1 by the United States Army Air Corps, will be held in Cleveland with headquarters at the Cleveland Municipal Auditorium, November 17-20. The twenty-fifth annual hospital standardization conference sponsored by the college will be held simultaneously. The program will include panel discussions, clinical conferences, scientific sessions, hospital meetings, medical motion picture exhibitions at headquarters and operative clinics and demonstrations in the local hospitals and Western Reserve University School of Medicine. The program of both meetings will begin with a joint general assembly on Tuesday morning, November 17, with addresses by Surg. Gen. James C. Magee, U. S. Army; Surg. Gen. Ross T. McIntire, U. S. Navy; Surg. Gen. Thomas Farrar, U. S. Public Health Service; Lieut. Col. George Baehr, chief medical officer of the U. S. Office of Civilian Defense; Dr. Frank H. Lahey, Boston chairman, directing board, Procurement and Assignment Service; Dr. Irvin Abell, Louisville, Ky., chairman of the board of regents of the college and chairman of the Health and Medical Committee of the Federal Security Agency; and Dr. William Edward Gallie, Toronto, president of the college. The surgeon generals and Colonel Baehr will also speak at the presidential meeting and convocation the same evening. The Forum on Fundamental Surgical Problems inaugurated at the 1941 Clinical Congress, will be repeated to give the younger men, representing various university departments of surgery, an opportunity to present the important results of their clinical and experimental research work before a large surgical meeting. The forum will be held on three successive mornings.

**Society News**—Dr. George W. Kosmak, New York, is president of the American Gynecological Society for the ensuing year and Dr. Howard C. Taylor, Jr., New York, secretary. —Carl R. Moore, Ph.D., Chicago, was named president-elect for the Association for the Study of Internal Secretions at the recent annual meeting and Dr. Eberle Kost Shelton, Los Angeles, was inducted into the presidency. Dr. Henry H. Turner, Oklahoma City, was reelected secretary. The next annual session will be in Cleveland, April 5-6, 1943. —Dr. Robert L. Moorhead, Brooklyn, was elected president of the American Broncho-Esophagological Association at its annual meeting in June. Dr. Fletcher D. Woodward, Charlottesville, Va., is vice president and Dr. Paul H. Holinger, Chicago, secretary. —Dr. Zoe A. Johnston, Pittsburgh, was chosen president-elect of the American Medical Women's Association during its recent meeting in Atlantic City and Dr. Helena T. Ratterman, Cincinnati, was installed as president. Dr. Mabel E. Gardner, Middletown, Ohio, is secretary. The association will meet in San Francisco in 1943, two days previous to the opening of the annual session of the American Medical Association. —Dr. Grover C. Penberthy, Detroit, was chosen president-elect of the American Association for the Surgery of Trauma at its annual meeting in Boston, June 6, and Dr. Charles S. Venable, San Antonio, Texas, was installed as president. Other officers include Drs. Ralph G. Carothers, Cincinnati, vice president; Gordon M. Morrison, Boston, secretary; and Arthur R. Metz, Chicago, treasurer. —Dr. Thomas H. Dickson, medical director of the Minnesota Mutual Life Insurance Company, St. Paul, was elected chairman of the medical section of the American Life Convention at its annual meeting in Denver recently. He succeeds the late Dr. Wilton F. Blackford, Louisville, Ky. Dr. Benjamin F. Byrd, medical director of the National Life and Accident Insurance Company, Nashville, Tenn., is the secretary. —Roy C. Newton, Ph.D., vice president in charge of research for Swift & Company, Chicago, was named president of the Institute of Food Technologists at its annual conference in Minneapolis. Edwin J. Cameron, Ph.D., National Canners Association, Washington, D. C., was named vice president and George J. Hucker, Ph.D., New York Agricultural Experiment Station, Geneva, secretary-treasurer. —The American Association for the Advancement of Oral Diagnosis will hold its ninth annual congress at the Forsyth Dental Infirmary in Boston, November 12-13, on the

theme "The Military Aspects of Oral Diagnosis." H. Justin Ross, DDS, 515 Madison Avenue, New York, is the secretary.—The annual meeting of the International Association of Milk Scientists will be held in St. Louis, October 30-31, with headquarters at the Hotel Jefferson. Frederick W. Fabian, PhD, Lansing, Mich., is president and Mr. C. S. Lee, Albany, N. Y., is secretary-treasurer.—The annual meeting of the Southern Psychiatric Association will be held in Richmond, Va., November 6-7 immediately preceding the annual convention of the Southern Medical Association.

#### Deaths in Other Countries

Premier Dr. Refik Saydam, formerly a medical attendant to the late Mustafa Kemal "Atatürk" and health minister in the first Republican Cabinet, died in Istanbul, Turkey, according to a dispatch of July 8. Dr. Saydam served as interior minister in 1938 and became prime minister in 1939. He had been secretary general of the Republican People's Party since 1938. According to the *New York Times*, Dr. Süleüddin Refik Pev, as he was known until Kemal Atatürk reformed Turkish names, was head of the public health administration in Simsim when he met Kemal Atatürk. He became the doctor's physician and entered politics.—Dr. Federico Grande Rossi, Havana, Cuba, died on July 11, aged 76. He graduated at the University of Havana in 1888.—Prof. Richard Willstaetter, 1915 Nobel Prize winner in chemistry for his research in chlorophyll and other vegetable colorings, died in Locarno, Switzerland, aged 70, of heart disease. In 1933 Dr. Willstaetter received the Willard Gibbs Medal of the Chicago section of the American Chemical Society. His research with cocaine alkaloids culminated in the synthesis of cocaine and made possible the commercial synthesis of local anesthetics. He attacked the quinine and quinaoid substances and discovered orthoquine and proof of the structure of aniline black. Dr. Willstaetter's experiments with the crotonoids have made possible the separation of the individual components of this group.

#### CORRECTIONS

**Decree of Nullity of Marriage Obtained by Blood Test**—In the London Letter appearing in the July 25 issue (page 1038 last paragraph) the child's group should have been listed as ABMN instead of as ABN.

**Pregnandiol Excretion**—In the article by Genit and Bronstein entitled "Pregnandiol Excretion in Female Pseudohermaphroditism" in *THE JOURNAL*, June 27, page 705, in the second column, ninth line, the word "menstruation" should have been "menses."

### Government Services

#### Annual Report of Public Health Service

The seventieth annual report of the U. S. Public Health Service for the fiscal year 1941 states that the provisional death rate from all causes for the calendar year 1940 was 10.5 per thousand of population, about 1 per cent higher than in 1939, when the lowest death rate in the history of registration occurred. The maternal mortality rate declined for the eleventh consecutive year. Only fifteen of forty-one states reporting had an increase over 1939. For the entire group the rate for 1940 was 3.6 per thousand births. The 1940 infant mortality rate of 47 per thousand live births was the lowest on record, representing a decline of 16 per cent from the rate of 56 per thousand for 1936. There was a slight increase in the birth rate for 1940, available data for the first quarter of 1941 indicate that the upward trend will continue. The 1940 death rate from automobile accidents was 24.3 per hundred thousand of population, the highest since 1937. Data for the first quarter of 1941 indicated an alarming increase in automobile fatalities, the rate increased 22 per cent over that for the first quarter of 1940.

Despite continued warnings, plague in rodents continues to spread eastward. One fatal human case was reported in 1940.

The report discusses the cooperation of the public health service with other agencies and mentions particularly the twenty-two fellowships in public health and medicine granted in 1940-1941 to medical graduates from Latin American countries. Other activities included the appointment of a special committee to study civilian defense in Great Britain and the development of a program for emergency medical service in the Office of Civilian Defense, Washington.

The most important health legislation enacted during the year was designed to assist the service in meeting the special problems created by the national defense program. Congress in March 1941 appropriated more than \$500,000 to provide public health service personnel and facilities to state health departments in critical areas. The regular appropriation to the service for the fiscal year 1942 included a sum of \$1,235,000 for emergency health and sanitation activities. In a subsequent act an additional \$1,940,000 was allocated to expand these services. A further appropriation of \$1,250,000 was made to assist schools of nursing in training additional student nurses and in providing refresher courses and postgraduate training.

Emphasis was placed on the federal-state cooperative programs for general public health services, venereal disease control and industrial hygiene. In 1940 officials of the army, the navy and the public health service and state health departments signed a working agreement for the control of venereal diseases in extracantonment areas. The state health departments, with the cooperation of the public health service, agreed to prosecute the control of venereal disease in civilian populations contiguous to military camps, and the army and navy agreed to supply information on contacts of infected military personnel to local health authorities. Prostitution complicates the control of venereal disease in practically all defense areas. The Selective Service System adopted the routine blood testing of all registrants called for physical examination. The tests were made in the state laboratories, and the public health service undertook to tabulate the results of the serologic tests and of physical examinations for syphilis and gonorrhea. Preliminary reports indicate that clinical syphilis rates are much lower among the first million men examined in 1940 than in the first million examined in 1917. The data reveal a wide variation in the prevalence of venereal disease from state to state. Just prior to the close of the fiscal year a venereal disease control program in representative defense areas was planned in cooperation with the Works Projects Administration to evaluate methods of venereal disease control in selected areas, including urban communities of varying population sizes and rural communities. Special emphasis will be placed on the follow-up and treatment of contacts of military and industrial personnel. In 1935 only six states had functioning industrial hygiene services. In 1941 thirty-two states and four large cities had industrial hygiene units, reflecting the impetus given to these programs under title VI of the Social Security Act. In February 1941 the subcommittee on industrial hygiene and medicine of the Health and Medical Committee designated the Division of Industrial Hygiene of the public health service as the agency to coordinate all activities for the health of defense workers and, under the program adopted, special assistance has been effected and concentrated projects have been launched.

Two new buildings at the National Institute of Health, Bethesda, Md., were occupied during the year, completing the physical plant of the institute. A division of chemotherapy in the institute was created by merging the functions and personnel of the division of pharmacology, the nutrition unit of the division of chemistry and the chemotherapy unit of the division of infectious diseases. A unit for coordination of research in the field of gerontology was set up and a national advisory committee created.

Substantial protection against whooping cough by use of a two dose alum precipitated pertussis vaccine developed at the National Institute of Health constitutes one of the most immediately practical accomplishments during the year. A hyperimmune rabbit serum for the treatment of Rocky Mountain spotted fever also was developed. Present indications are that in the serum a useful therapeutic agent is found for the first time. Other research showed that, contrary to popular conception, there is little difference in the severity of Rocky Mountain spotted fever in Eastern states as compared to the Northwestern states, where it has long been thought excessively virulent. New foci of the infection were found in sixty-two counties in eighteen states.

Of fifteen recommended grants-in-aid for cancer research, recommended by the National Advisory Cancer Council, twelve, totaling \$77,780, had been paid. Cancer control programs were established in Arizona, New Mexico, Wyoming, Montana and Idaho, bringing the total of state and territorial cancer programs to thirty-nine. Consultation services were provided to these organizations, and radium loans to forty-one hospitals were renewed and loans were made to three other institutions. About 2,000 patients were treated in these hospitals with government owned radium, thirty-one trainees in the diagnosis and treatment of cancer were on the payroll.

## SPECIAL NEWS

(THIS NEWS WAS ASSEMBLED ESPECIALLY FOR USE IN THE JOURNAL)

**Public Health Under Hitler's Rule**—The German government has passed a new law for the protection of mothers, which applies particularly to working women who replace men who have been called into the armed forces. The law, prepared in the Reich Ministry of Labor, according to DNB of May 15, insures the protection of all female workers. It prohibits the employment of pregnant and nursing mothers on a number of jobs which might harm them. Every woman must be completely exempt from every kind of work for six weeks before and six weeks after the birth of a child. This period is increased to eight weeks in the case of nursing mothers. The nursing of children is encouraged by the granting of a paid nursing period. The law prohibits employing pregnant and nursing mothers on overtime, nightwork and holiday work. The law has extended protection against dismissal far beyond its previous scope. Any one now who dismisses a pregnant woman because of her pregnancy commits a punishable offense. Women must not be given notice of dismissal for other reasons from the beginning of pregnancy until four months after childbirth. Mothers will receive during the protection periods a weekly sum corresponding to the full amount of their wages. Employers must continue to pay regular wages to women not insured under the health insurance scheme provided by law. The new law, according to DNB, is an eloquent expression of the gratitude which Germany shows to its working mothers.

According to the *Deutsche Tuberkulose-Blatt* of April, Dr. Elisabeth Delhoff, a specialist for pulmonary diseases in Dresden, writes: "We have abundant work for our people, and every employer is only too glad to find a worker without asking much about the state of his health. About 60 per cent of all persons with open pulmonary tuberculosis and 80-90 per cent of those with stationary tuberculosis are now employed, partly in very unsuitable occupations. The ideal would be to find for all patients, whether with open or stationary tuberculosis, suitable jobs which do not make them ill again and in which they can earn their living without infecting other people. This would be the only sensible way of absorbing the 400,000 persons with open pulmonary tuberculosis into the economic life of Germany. These people constitute a valuable source of labor which we can ill afford to waste."

The *Petit Journal* of April 23 quotes from an article by Dr. Henri Bouquet in *Le Temps*. Already children are being born whose weight is far below normal. This state of affairs is not likely to improve, and it has been established that undernourishment seriously impairs the reproductive organs of young women. If this danger is not remedied, we are heading straight for disaster. This same thing applies to boys and young men. An adolescent, in order to develop normally, both morally and physically, needs plenty of well balanced food. Does he get it in these days? Figures compiled by experts prove incontrovertibly that he does not. And so to underdeveloped mothers must be added the evil of fathers who are biologically immature.

Rickets was formerly an exception. Now there are an enormous number of cases, entailing deformation of the spine, which do not react to treatment. The increase both in quantity and in quality of this disease of the bones means a growing generation of people who are deformed or weak, women who not only have difficulty in delivery because their pelvic girdle is the wrong shape but who run a grave risk of having children deformed from their birth. Tuberculosis is also increasing in the number and gravity of its cases. We were warned of this by specialists of children's diseases when the new ration card was introduced. They told us that because of the meagerness of the rations allowed to children tuberculosis would find in them an easy prey. This prophecy has been fulfilled and is only too well demonstrated by figures. An enormous number of the children are victims, because their diet, especially from the age of 6 onward is deficient, and the number of deaths is increasing as the forms taken by the disease become graver. They are no longer exceptions. They are the rule. And what will be the fate tomorrow of those who escape?

Not only children are threatened but also young people who, having reached the age when their studies are intensified for taking examinations, run the risk of dangerous mental strain. Mental strain is possible for a short time only if it is balanced by increased rations. But now, the contrary is the case, and the danger becomes the greater in proportion."

*La Province de Namur* of April 28 reports that numerous cases of diphtheria have occurred in the neighborhood of Namur.

According to *Reggeli Magyarorszag* of April 16 the chief medical officer stated before a meeting of the Kolozsvár municipal council that the birth rate was constantly rising and that from 18 to 20 per cent of the births were illegitimate.

*Krakowski Visti* of April 28 reports that the Kiev Medical Institute has reopened and has many hundreds of students, of whom 80 per cent are Ukrainians and about 15 per cent Russians, but no Jews have been registered.

The first German clinic in the Banat which will provide medical advice for German families has been opened. According to *Donaueitung*, Belgrade, of April 28 there is a medical library, a kitchen, a consulting room and a lecture hall for nurses.

The Helsinki correspondent of the *Stockholm Tidningen* of April 28 writes that he visited the military hospital in the Olonets area, which he found overcrowded with the entire floor covered with beds one against the other. Beds, he said, keep receiving new occupants and, "if the sheets were not changed, they would never have time to cool."

The *Sydzsensla Dagbladet* of April 25 states that according to German reports only 591 cases of typhus (bauchtyphus) occurred in the army up to last autumn, whereas in the first world war 19,000 soldiers died of this disease the first year, only 18 cases of spotted typhus and 6 cases of tetanus were reported, as against 471 and 360 respectively in the last war, there were no cases of cholera as against 1,800 cases in the last war.

*Deutsche Rundschau*, Bydgoszcz, states that daily in chemists' shops in Bydgoszcz people are asking for things just because some one else in the shop has succeeded in buying them. "Ah! aspirin—let me have a box too," and people buy enough mixtures when they have no cough and ask for plasters which they stop themselves from buying only when they hear they are for rheumatism, which they have never suffered from. "There is a quite extraordinary demand for drops of all kinds, cholera (colic) drops, stomach drops, valerian, even concentrated (atherische) valerian are asked for again and again. There is no explanation but perhaps it is because these drops contain alcohol. This silly buying craze could have serious consequences, for it might mean that in some houses there were unused medicines lying about while those who really need them could not get any."

*Magyarorszag* states that Kecskemet is in quarantine because of an unspecified epidemic.

*De Telegraaf* carries an article by Professor van Sleswijk, who writes that the number of cases of diphtheria is rapidly increasing. In 1937 there were 1,068 cases, in 1940 1,733 cases, in 1941 5,434 cases, and in the first three and a half months of this year 3,369 cases.

*Nationalblat*, Luxembourg, reports that a census among holders of food cards last year gives an insight into the composition of the French population since the outbreak of the war. According to this census there are 39 million people in France today, almost two thirds of whom, 25 million, live in the occupied zone (Alsace-Lorraine with 19 million inhabitants is not included in these figures). In the occupied zone, including Paris and the thickly populated industrial districts of the north, there are 90 inhabitants per square kilometer, but in the unoccupied zone with the relatively sparsely populated Alpine districts there are only 56 per square kilometer.

Almost one fifth of the population lives in the nineteen large cities. The number of young people comprised in the population is constantly dropping and the number of elderly persons constantly rising. In unoccupied France there are more old people over 70 than children under 3 years of age. The predominance of these aged elements and the heavy war losses sustained have resulted in a large surplus of women: there are 1,072 women to every thousand men.

The *Neues Wiener Tageblatt* reports that the German-Slovak trade negotiations have been concluded. The objects of the negotiations were the supply of certain goods to the Slovak railways, the establishment of a company to produce clover, lucern and fodder grass seed for domestic and export purposes, and tourist traffic. It has been agreed that sick persons from Germany and the protectorate may visit Slovak watering places even without a medical certificate. Such persons will be selected by the Ministry of Interior or, if they have been insured by the respective invalid funds. Most of the patients in question suffer from tuberculosis or rheumatism. In order to cover the expenses of medical treatment a maximum of 400 reichsmarks per person monthly may be transferred. From this sum a maximum of 20 crowns daily may be paid out to the

visitor for personal expenses. The same regulations have been agreed on as to tourist traffic from Slovakia to Germany.

The *Bremer Nachrichten* says that country people are asked, in case of illness, to go first to the district nurse, who will if necessary call in a doctor. Only if this rule is observed will it be possible to assure medical help to people who are really ill and in need of treatment. To take some work off the shoulders of the heavily taxed doctors, midwives are now authorized to issue certificates confirming the existence of pregnancy in women.

*Der Deutsche Militärarzt*, Berlin, relates that a battalion of soldiers had been issued rations of sausage containing pork which was infected with trichiniae. The whole battalion, 617 men, subsequently suffered from trichinosis; 1 man died.

The *Kropotkin* announces that the people in the Piræus are being given typhus inoculations, and it is recalled that the Piræus was quarantined at the end of April because of an outbreak of typhus.

*Zora Solta* reports that there are 47 new cases of spotted typhus at Skopje.

Speaking in Hamburg by invitation of Guilelmo Krauffmann, the Reich health leader, Dr. Conti said that all the enemy's hopes of weakening the German home front as regards health and productive capacity had been a miserable failure. In fact even today, in the third year of the war, the productive capacity of the Reich remains everywhere undisturbed. Every possible care must be taken to keep the working people healthy. Admittedly times are not easy, and every individual must deal rigorously with himself. On the question of medical supplies, Conti said. If some headache cure has perhaps of late not always been obtainable from the chemist, this is not of the slightest importance for the health of the people as a whole. On the contrary, one may say that no harm would be done by the restriction of the consumption, among some people, of such medicaments, which has become habitual during the last few years. In the long run this would only benefit the health of the people concerned. On the other hand care has been taken to prevent a shortage of medical supplies which are essential to maintain the health and productive capacity of the German people and to combat epidemics. In wartime the production of medical supplies must be considered from the national health and not the economic point of view. Assistance for the mother with many children and for the expectant mother continues to occupy the first place. Now is the proper time, even in the midst of the fight against Germany's enemies, to lay the foundation stone for the building up of our people on the principles of eugenics. Every woman who now presents the nation with a child makes the highest contribution which, as a German, she can offer to her people.

The German Red Cross has agreed with the *rechtsjugendführung* to recognize the training given by the Hitler youth and the BdM for "feldscher" and health service girls respectively as equivalent to the basic Red Cross training. Future training will be based on a regulation concerning basic first aid training to be issued by the Reich health leader. The Red Cross will put training personnel and facilities at the disposal of the Hitler youth free of charge. The "feldscher" and health service girls are advised on leaving the HJ and BdM to enter a first aid unit of the Red Cross. All health service girls who are members of the "faith and beauty" scheme will be seconded between their seventeenth and twenty-first years for three months' training as auxiliary nurses with the Red Cross. In view of the heavy burden of work at present resting on doctors, the minister of labor has instructed all authorities, when issuing administrative regulations, to consider carefully whether the granting of benefits is to be made dependent on the submission of medical certificates. Where it is already the rule that such certificates must be produced, the authorities must see whether they can be replaced by some other form of evidence.

According to *Aftontidningen*, Stockholm, Norwegian doctors confirm that the difficult food situation in Norway is now beginning seriously to affect the health of the nation. The present rations do not provide the necessary calories, and an unbalanced diet and the insufficiency of vitamins is having a serious effect on the health of the people. The shortage of fat and vitamins is particularly fateful. Scurvy proper has not yet been diagnosed, but many cases of the latest type of scurvy

have occurred, caused by shortage of vitamins. The symptoms are tiredness and the inability to work as usual. Jaundice, diphtheria, measles and other sicknesses, which have been very prevalent in Norway recently, are also partly to be attributed to the shortage of vitamin C. Jaundice has been very prevalent lately. In some places up to 25 per cent of the population is suffering from it and the authorities have been compelled to take steps to endeavor to stop it from spreading. Since the introduction of compulsory vaccination there has been much less diphtheria. Measles was very prevalent during the winter, and infantile mortality was much higher than usual. Extraordinary measures have had to be taken to combat the scab, which is widespread. The shortage of pure soap and the deplorable housing conditions are making themselves seriously felt. Impetigo, often accompanied by face sores, is now so common that the sufferers must report to doctors. Ulceration of the stomach is more prevalent than before. Venereal disease is increasing, particularly in the cities. The food situation is worst for men working in the forests and it is becoming increasingly difficult to get men for this work. Lately, lumbermen's food has consisted of potatoes only for breakfast and supper. The bread ration had to be reserved for dinner, as it is impossible to obtain either meat or pork and the lumbermen cannot take fish to the forests.

*Lyllisavisen*, Skien, contained an item to the effect that "the Telemark county hospital has been requisitioned by the German Wehrmacht. At present patients are being discharged on as large a scale as possible. The hospital had to be fully evacuated by July 1. Evacuations are being made to find room in other parts of Telemark." This was signed by the county sheriff of Telemark.

The *Frankfurter Zeitung* begins an article on the wartime restrictions of the manufacture of medical preparations by assuring all persons who may feel worried that they will not be exposed to the ravages of their disease without the protection of the medicaments which they need. "But even so certain tensions are inevitable, and it cannot be denied that we shall have to adapt ourselves in certain ways, in some cases accept substitutes, and make the sale of more preparations subject to a doctor's prescription." Aperients are one of the categories which are in short supply. The usual aperients are imported from abroad and are therefore no longer available in the customary quantities. On the other hand, constipation may have increased to a certain extent, perhaps because the changed diet does not always entirely agree with people. Nobody takes aperients for pleasure, and the increased purchasing power of the population does not therefore enter into it. The demand for invigorating and vitamin preparations has become particularly pronounced. Obviously everybody would like to maintain his nerves and his working capacity in order to remain equal to the higher demands made on him. The use of sedatives and anodynes derived from barbituric acid and its homologues has become so common in a manner bordering on addiction that the restriction of the sale of these preparations against a doctor's prescription can only be welcomed as a measure which will benefit the health of the people. The position is similar as regards preparations containing quinine. The disappearance of a number of preparations means that many people will have to go without some remedy or other to which they had got used and which has proved its worth. But as far as the problem of medical preparations as a whole is concerned, this can only mean an improvement. For the market was flooded with such a wealth of similar preparations with similar effects, which differed only in the manner of their publicity, that a severe measure of concentration can do no harm.

*Havas* reports from Istanbul that it has been learned from Athens that cases of typhus have appeared in certain hospitals and the prison at Piræus. The government has ordered that all cafes, cinemas and theaters are to be closed immediately. The occupying authorities are collaborating with the local authorities in the fight against the epidemic. Public services are rounding up beggars and compelling them to take baths while their clothes are being disinfected.

The *Stockholm Tidningen* publishes a report received from Berlin on June 20 that in Belgium the number of deaths exceeds the births. During April there were 8,745 births and 10,237 deaths, of which 5,601 were men and 4,636 women. In comparison with April 1941 the birth rate has decreased by 12 per cent and the death rate by 521 per cent.

July 11, 1942

#### The National Health After Nearly Three Years of War

Good reports on the national health during the war have previously been given (*THE JOURNAL*, Dec 13, 1941 p 2089, May 30, 1942, p 431). The survey can now be extended to the third winter of the war and most of the third year, with similar results. In the House of Commons the minister of health, Mr Ernest Brown, stated that after one thousand days of war the health of the nation was in many respects better than in days of peace. The birth rate of 1941 was 14.2 per thousand as compared with 15.1 in 1938 and 20.9 in 1916. (This only exemplifies the falling birth rate, which was causing concern before the war.) But for the first quarter of 1942 the rate was 15.5, the highest in any March quarter since 1931. The rise can be accounted for by the increase of marriages promoted by the allowances paid for wives and children of the young men joining the fighting services. The infant mortality rate for 1941 was 59 as compared with 53 in 1938 and 91 in 1916. The rate for the first quarter of 1942 was 61, the lowest rate for any first quarter on record. The maternal mortality rate in 1941 was 277 per thousand births as compared with 297 in 1936 and 412 in 1916. Thus while over a long period the birth rate had been falling over the same period the survival rate had increased. The "crude general death rate" was 12.9 in 1941 as compared with 11.6 (the lowest on record) in 1938 and 14.4 in 1936. The risk of epidemic disease calls for special care in wartime but during the past two and one half years of war the infectious disease rate has been normal and on the whole, below the average.

Apart from tuberculosis, the only infectious disease which has shown a rise during the war is cerebrospinal fever. This was expected since cerebrospinal fever has always been a wartime disease. In 1916 there were about 2,000 cases and in 1938 and 1939 1,500 and 1,300 respectively. But in 1940 there were nearly 13,000 and in 1941 over 11,000 and, for the first half of 1942 4,000. The fatality of the disease has been reduced from a percentage of 69 in 1935 to 34 and more recently to 20.

The problem of tuberculosis is causing some concern. There were 28,669 deaths due to it in 1941 compared with 28,144 in 1940, 26,176 in 1938 and 53,858 in 1916. The steady fall in tuberculosis which has been a feature of the twenty-five years of peace has been interrupted in the last two years. Wartime conditions, such as the blackout, overcrowding and the cessation of house building predispose to tuberculosis. In the past we tended to concentrate on treatment rather than on early diagnosis. The recent developments in miniature radiography are providing a new weapon to detect cases for more detailed examination. From earlier diagnosis better results in treatment are expected. Also rehabilitation and securing gradual return to suitable employment is to be tackled on more comprehensive lines.

The incidence of diphtheria, the chief killing disease of children between 4 and 10, has not fluctuated very widely in the last twenty-five years but the number of deaths has fallen from 5,300 in 1916 to 2,600 in 1941. During the past year the Ministry of Health has been engaged in a campaign for immunization of children against diphtheria and this has given striking results in reducing both incidence and fatality of the disease. Scarlet fever has become a scourge of the past and there were only 133 deaths from it in 1941. In that year there were only 148 deaths from typhoid and fewer than 5,000 as compared with 6,000 cases and 1,100 deaths in 1916. During the heavy bombing of our cities not a single death from typhoid was due to

pollution by water borne infection, in spite of the continuous bombing of our crowded areas. American visitors marveled at this. The number of deaths from pneumonia was much greater in 1941 than from all the other infectious diseases combined other than tuberculosis. There were 50,000 cases and 26,000 deaths compared with 29,000 deaths in 1940 and 23,000 in 1939.

An increase in venereal diseases was not unexpected in view of war conditions but was not so great as in the last war. At the outset steps were taken to expand the existing services. We have always relied on propaganda and education for controlling these diseases. But the work of limiting the spread of infection was hampered by lack of powers to deal with persons unwilling to submit to treatment and known to infect others. This difficult problem is engaging attention.

#### THE SUPPLY OF NURSES

At the end of April 1939 the number of state registered nurses was 94,200. In April 1942 the number had risen to 103,700. But there is still a shortage, and 12,000 more are required. The tuberculosis service in particular has exceptional difficulties in securing adequate numbers. Fear of contracting the disease in sanatoriums appears to be a factor, though the authorities hold that there is no greater risk than in other hospitals.

#### SHORTAGE OF DOCTORS

The demand for doctors in the fighting forces has entailed a shortage for civilian purposes. The government has asked the public to recognize the difficulty and do what it can to limit calls to what is essential.

#### Hospitality to Americans

The eagerness of individuals and private societies to show good will toward Americans both soldiers and civilians, now in this country has produced numerous offers of hospitality. The government has made arrangements to complete and coordinate such offers. At the request of the secretary of state for foreign affairs, Sir Edward Grigg M. P. (lately undersecretary for war), became chairman of a small committee to advise on the measures required. The committee has been instrumental in providing facilities, including residential clubs for the exclusive use of American civilians and officers. At the request of the American Red Cross the committee has been supplementing its work, which includes the responsibility, conferred on it by the United States government for the welfare of the American Expeditionary Force. The committee also concentrates on the needs of the many American civilians assisting our war effort.

#### Operation on the Heart on the Battlefield

During a battle in Libya a bomb splinter nearly an inch wide lodged in the wall of an anti-aircraft gunner's heart. He was taken to a field hospital under field conditions with the battle raging outside, and an operation was performed on his heart. For two and one half hours the surgeons worked. A few days later the gunner was well enough to be sent to a base hospital. The doctors in charge of the field unit paid tribute to the orderlies, whose expert nursing helped the recovery.

## Marriages

WILLIAM SMITH BROCKINGTON, Charleston S. C., to Miss Florence Virginia Blake of Kingstree May 28.

PHILIP HENRY LIVINGSTON, Chattanooga, Tenn., to Miss Jean Doris Wicksman of Nashville May 24.

JOSEPH LEE MANN to Miss Nan West Phillips both of Hampton, Va. at Sebring, Fla., June 19.

HERBERT CARL LEE, Milwaukie, to Miss Dovie Johnson Kinlaw of Lumberton, N. C., recently.

FREDERICK FIRESTONE, Jamaica, N. Y., to Miss Sophie Barbara Witzling of New York May 24.

## Deaths

**Wade Hampton Brown**, Princeton, N J, Johns Hopkins University School of Medicine, Baltimore, 1907, instructor of pathology at the University of Virginia, 1907-1908, instructor of pathology from 1908 to 1910 and assistant professor 1910-1911 at the University of Wisconsin, Madison, professor of pathology at the University of North Carolina, Chapel Hill, from 1911 to 1913, joined the Rockefeller Institute for Medical Research in 1913 serving there as an associate member from 1914 to 1922, when he became a member of the scientific staff for medical research, member of the Association of American Physicians, the American Association of Pathologists and Bacteriologists, the American Society for Experimental Pathology and the American Society for Pharmacology and Experimental Therapeutics, aged 65, died, August 1, at Rice Lake, Wis.

**Hector Wright Benoit**, Brooklyn, McGill University Faculty of Medicine, Montreal, Que, Canada, 1909, member of the Medical Society of the State of New York, fellow of the American College of Surgeons, past president of the Brooklyn Surgical Society, formerly assistant clinical professor of surgery at the Long Island College of Medicine, specialist certified by the American Board of Surgery, on the staffs of St. Luke's Hospital (Newburgh), Bushwick Hospital, Prospect Heights Hospital, Midwood Hospital, Peck Memorial Hospital and the Methodist Hospital, attending surgeon and past president of the medical board of the Kings County Hospital, aged 58, died, June 27, of myocarditis.

**Louis Henry Dyke** ♂ Oakland, Calif, Oakland College of Medicine and Surgery, 1916, fellow of the American College of Surgeons, on the staffs of the Alameda County, Peralta and Providence hospitals, Oakland, and the Alta Bates and Berkeley hospitals, Berkeley, aged 64, died, June 2.

**Hannibal Blair**, Ocoosa, Wash, Willamette University Medical Department, Salem, Ore, 1883, at one time member of the state legislature, formerly mayor and member of the school board of Elma, aged 86, died, June 10, in the Elma (Wash) General Hospital of coronary disease.

**Clement Carl Fihe** ♂ Cincinnati, Medical College of Ohio, Cincinnati, 1900, fellow of the American College of Physicians, aged 66, on the staffs of the Good Samaritan Hospital, Cincinnati General Hospital and the Christ Hospital, where he died, June 15, of coronary thrombosis.

**Stanley Cullen Cox** ♂ Holyoke, Mass, University of Michigan Department of Medicine and Surgery, Ann Arbor, 1910, member of the New England Surgical Society, fellow of the American College of Surgeons, served during World War I, aged 58, died, June 7.

**Francis Joseph Butler** ♂ Worcester, Mass, Georgetown University School of Medicine, Washington, D C, 1908, aged 58, on the staffs of the Hahnemann Hospital and St Vincent's Hospital, where he died, June 7, of uremia, hypertension and chronic nephritis.

**Robert Starke Carey**, Washington, D C, University of Maryland School of Medicine, Baltimore, 1908, medical officer with the Veterans' Administration and with the Board of Veterans' Appeals, aged 65, died, June 1, in the Georgetown Hospital.

**Elijah Tennyson Dando**, Wellston, Ohio, Kentucky School of Medicine, Louisville, 1898, Jefferson Medical College of Philadelphia, 1900, for many years postmaster, aged 65, died, June 27, in the Holzer Hospital, Gallipolis, of cerebral hemorrhage.

**James Dennis Barrett**, South Pasadena, Calif, Northwestern University Medical School, Chicago, 1906, member of the California Medical Association, aged 61, died, June 10, in the Columbus Hospital, Seattle, of lobar pneumonia.

**Hugh John Roy Lindsay**, Woodstock, Ont, Canada, University of Toronto Faculty of Medicine, Toronto, Ont, 1906, aged 56, died, May 16, in the Woodstock General Hospital of hemolytic staphylococcus septicemia.

**Nelson Henry Clark** ♂ Pittsburgh, Harvard Medical School, Boston, 1904, on the staff of the Western Pennsylvania Hospital, aged 68, died, June 16, of cholecystitis and postoperative pneumonia.

**John Lane Evans** ♂ Brookfield, Mo, University of Pennsylvania School of Medicine, Philadelphia, 1920, past president of the school board of Brookfield, aged 46, died, June 24, of myocarditis.

**Giles S Hall** ♂ Los Angeles, Rush Medical College, Chicago, 1897, aged 73, died, June 4, in the Southern Pacific General Hospital, San Francisco, of uremia and nephrosclerosis.

**William T Gilman**, Chicago, Hahnemann Medical College and Hospital, Chicago, 1896, member of the Illinois State Medical Society, aged 81, died, June 10, of chronic myocarditis.

**Joseph Chandler**, Pardeeville, Wis, Chicago Medical College, 1889, member of the State Medical Society of Wisconsin, aged 76, died, June 16, in Milwaukee of chronic myocarditis.

**Albert E Copp**, Flint, Mich, Detroit College of Medicine, 1896, formerly mayor of Vassar, at one time coroner of Tuscola County, aged 78, died, June 17, of organic heart disease.

**Jennie Anna Duncan**, Ottawa, Ill, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1910, aged 81, died, June 28, of cerebral hemorrhage.

**James Carroll Nash**, Harlan, Ky, Lincoln Memorial University Medical Department, Knoxville, Tenn, 1911, aged 60, died, June 12, of hypertensive cardiovascular disease.

**Angus L Cowan**, Detroit, Detroit College of Medicine, 1891, member of the Michigan State Medical Society, aged 76, died, June 21, of myocarditis and coronary sclerosis.

**Jane Steele Divine**, Atlantic City, N J, Woman's Medical College of Pennsylvania, Philadelphia, 1887, aged 82, died, June 16, of acute infection of the urinary tract.

**Hans August Reinhard**, Milwaukee, Rush Medical College, Chicago, 1903, aged 63, on the staff of St Mary's Hospital, where he died, June 8, of cerebral hemorrhage.

**William G Brayton**, Carey, Ohio, Medical College of Ohio, Cincinnati, 1873, aged 93, died, June 7, in the Sawyer Sanatorium, Marion, of hypostatic pneumonia.

**Henry P Clarke**, Indianapolis, Medical College of Indiana, Indianapolis, 1892, aged 75, died, June 25, in St Vincent's Hospital, of coronary occlusion.

**Charles F Grunewald**, Los Angeles, Hahnemann Medical College and Hospital, Chicago, 1892, aged 81, died in June, of auricular fibrillation.

**Robert R Cornell**, Birmingham, Ala, Chattanooga (Tenn) Medical College, 1902, aged 73, died, June 4, of chronic nephritis and uremia.

**Olin Burr Hall** ♂ Dayton, Ohio, University of Cincinnati College of Medicine, 1922, aged 49, died, June 8, of Addison's disease.

**Samuel W Chavis**, Chicago, Leonard Medical School, Raleigh, N C, 1911, aged 57, died, June 2, of poison, self administered.

**Albert Pain**, Hamilton, Ont, Canada, University of Toronto Faculty of Medicine, 1906, aged 58, died, June 28.

**Estill Nelson Burke**, Catlettsburg, Ky, University of Louisville School of Medicine, 1926, aged 43, died, June 2.

**Frederick D Brown**, Richmond, Va, Leonard Medical School, Raleigh, N C, 1912, aged 54, died, June 14.

## DIED IN MILITARY SERVICE

**John Maurice Hayes** ♂ Decatur, Ill, St Louis University School of Medicine, 1914, called to active duty as a lieutenant colonel in the medical reserve corps of the U S Army Oct 10, 1941, was awarded the British Military Cross for bravery while in service with the British Army during World War I and was a member of the Order of the Purple Heart, aged 57, stationed at Camp Forrest, Tenn, where he died, June 29, of coronary thrombosis.

**Olon H Coleman** ♂ Chattanooga, Tenn, University of Tennessee College of Medicine, Memphis, 1932, major in the medical reserve corps of the U S Army, called to active duty Jan 15, 1941, served as registrar at Station Hospital, Camp Blanding, Fla, until May 1, 1942, formerly connected with the Tennessee Department of Public Health, aged 34, died, July 20, in the African middle eastern theater of war.

**Joseph Franklin Showers**, Milton, Pa, Hahnemann Medical College of Pennsylvania, Philadelphia, 1940, appointed a first lieutenant in the medical reserve corps of the U S Army, Nov 1, 1941, attached to the Second Armored Signal Battalion at Camp Polk, La, where he died, July 26, aged 28, of acute epidemic hepatitis.

## Bureau of Investigation

### STIPULATIONS

#### Agreements Between Federal Trade Commission and Promoters of Various Products

The following items are abstracts of stipulations in which promoters of "patent medicines," cosmetics or medical devices have cooperated with the Federal Trade Commission to the extent of agreeing to discontinue certain misrepresentations in their advertising. These stipulations differ from the "Cease and Desist Orders" of the Commission in that such orders definitely direct the discontinuance of misrepresentations. The abstracts that follow are presented primarily to illustrate the effects of the provisions of the Wheeler-Lea Amendment to the Federal Trade Commission Act on the promotion of such products.

**Chippewa Natural Spring Water**—This was represented in the advertising to rid the system of poison, toxins or waste to be the only natural spring water which can be given to infants without boiling or with safety and to possess therapeutic properties in the treatment of kidney disorder, rheumatism or arthritis. In June 1942 the Chippewa Springs Corporation and the Hutchinson Advertising Company both of Minneapolis and Vince B. Nyhan trading as Chippewa Spring Water Company Chicago stipulated with the Federal Trade Commission that they would remove the foregoing misrepresentations from their advertising. Further all these stipulators agreed to cease representing that the minerals contained in competitive commercial waters are of no benefit to the user. The Chippewa Springs Corporation separately stipulated that it would cease representing that Chippewa Natural Spring Water when eliminated, carries with it more waste matter than do competitive commercial waters.

**Dr. George R. Davis Shoes**—In August 1941 Knapp Brothers Inc. Brockton Mass. stipulated with the Federal Trade Commission that it would discontinue the following misrepresentations in the sale of these shoes that it has been shown that 90,000,000 or any other definite number or percentage of persons in the United States have some form of foot trouble that physicians agree that 50 or any other number or diseases are the direct result of ailing feet or that any disease directly results from this condition that this concern's shoes stimulate normal circulation or possess an antiseptic toe lining that they give proper support to the arches (unless it is explained that in unusual cases they are not equipped to do so) that they assure perfect ankle alignment, correct eliminate prevent or banish flat feet or kindred disorders or defective posture that they afford instant relief and will banish correct, eliminate or prevent corns (this claim applies only to proper fitting) or that the wearing of Dr. George R. Davis Anti Friction Shoes assures normal feet.

**Mint Rub**—In July 1941 the Bristol Myers Company New York signed a stipulation with the Federal Trade Commission agreeing to cease representing that this product is a special analgesic that it has any effect on colds beyond relieving chest colds or that it penetrates to any muscles other than superficial ones or affords certain other benefits. This stipulation was an amendment to one that the same concern signed with the Commission in September 1937.

**Minton's Asthma Remedy**—This is put out by E. L. Bachman and V. E. Chambers trading as the Sarcos Remedy Company, Sidney Ohio. In June 1942 these persons stipulated with the Federal Trade Commission that they would discontinue the following misrepresentations in their advertising: that their product will prevent remedy or correct asthma or any underlying cause of this condition or offer any value in its treatment beyond furnishing limited temporary relief from paroxysms due to or associated with asthma that the preparation is a preventive remedy or cure for hay fever or a treatment for bronchial trouble in excess of its action as an expectorant in minor bronchial irritations or that it has substantial therapeutic value in treating such disorders or will restore health. Further the respondents agreed that they would disseminate no further advertisements which failed to reveal that their product should not be taken by persons suffering with active or arrested tuberculosis or toxic goiter without first consulting a qualified physician and that should nausea or skin eruptions follow its use the dose should be reduced. It was permitted however to limit the warning to the statement "Caution: Use only as directed" if the same warning appeared in the directions on the label. The respondents further stipulated that in their trade or brand names they would desist from using the word "remedy" or any abbreviation thereof or any other word term or abbreviation whose phonetics, spelling or appearance might suggest that the preparation is a preventive, corrective or remedy for asthma hay fever or bronchial troubles.

**Natural Ray Mineral Water**—This was sold under the misrepresentations that it is a remedy or cure for stomach, bladder and kidney disorders, chronic constipation, paralysis, high blood pressure, anemia, glandular difficulties and various forms of rheumatism among other things that it is a safeguard a body builder a way to gain, retain or maintain health a preventive of infantile paralysis or other illness or a aid to muscle or bone development that it affects the appetite, the weight or the ability to sleep, builds up resistance to colds or headaches or wards off colds. Such misrepresentations were to be discontinued according to a stipulation signed with the Federal Trade Commission

in August 1941 by the Michigan Magnetic Mineral Water Company and the Natural Ray Mineral Water Company, the latter trading as such and as the Michigan Mineral Water Company, of St. Louis. In September 1941 Charles F. Dowd Inc., Toledo Ohio which handles the advertising of the product in question also stipulated with the Federal Trade Commission that the foregoing misrepresentations would be discontinued.

**Nature Nerveine**—In July 1942 one Valentine Greenwald trading as Protes or V. Greenwald Covington Ky. signed a stipulation with the Federal Trade Commission which provided that he would cease using the term "Nature Nerveine" or any other name representing or implying that the product so designated is a remedy of nature or beneficially affects nerves or nerve disorders that it has any value in treating epilepsy, exhaustion, insomnia, stomach disorders and other ailments that it tones blood, strengthens the nerves, builds the brain or promotes health and that it has any physiological action except as a stomachic and mild carminative.

**Nutrase and Kleen**—Edward Howell trading as Medford Laboratory Chicago stipulated with the Federal Trade Commission in August 1941 that he would no longer represent that either of these products is a cure or remedy for food discomfort, indigestion, gas, heartburn, gastro-intestinal symptoms, cancer, diabetes, liver trouble or other ailments that Nutrase is free from drugs or will impart new life or energy or that Kleen affords perfect intestinal elimination.

**Old Mohawk**—In June 1942 Edgar S. Gehhart trading as Miami Advertising Agency J. W. Daugherty trading as Mohawk Medicine Company and The Quaker Herb Company signed a stipulation with the Federal Trade Commission in which they agreed to cease representing that Old Mohawk is safe to use and is a cure for dizzy spells, biliousness, bloating, unsound sleep and other ailments or has therapeutic value except as a temporary laxative for the relief of constipation. Further they agreed to discontinue designating symptoms of diseases or conditions not generally caused by or directly associated with constipation in any manner representing that these symptoms are typical manifestations of constipation or that their presence indicates that the sufferer has constipation. Also to be discontinued were advertisements which failed to reveal the potential danger in using Old Mohawk when nausea, vomiting, abdominal pain or other symptoms of appendicitis are present provided however that if the labeling contains adequate warning of such danger the advertising need bear only the statement "Caution: Use only as directed."

**Perspiration**—This Turkish bath cabinet was represented in the advertising as a cure or remedy for excess fat which would keep the pores open, cure colds and help to replace sallow, sluggish skin with a healthy, youthful glow and to remove blackheads and the cause of skin blemishes. In a stipulation signed with the Federal Trade Commission in June 1942 Louis Gordon trading as Gordon Brothers, Brooklyn agreed to discontinue these misrepresentations and any advertisements which failed to reveal that a normal person might faint and suffer burns when using the device unattended. It was permitted however to limit this warning to the statement "Caution: Use only as directed" if the accompanying directions contained the adequate necessary warning.

**Rex Lex**—The Rex Remedy Company, Shelby N. C. signed a stipulation with the Federal Trade Commission in June 1942 to discontinue the following representations for their product that it is superior to and outsells all competing brands of headache remedies, produces a rested feeling and always relieves nervousness, dizziness or all kinds of pain. The concern further agreed to discontinue any advertisements which failed clearly to reveal that Rex Lex should not be used in excess or the recommended dose lest it cause dependence on a drug and should not be taken by children. It was provided however that this detail could be substituted in the advertising by the simple statement "Caution: Use only as directed" when the labeling carried a warning to the same effect. The Commission reported that Rex Lex contained acetanilid and potassium bromide.

**Triner's Bitter Wine and Triner's Wine Tonic**—In a stipulation signed with the Federal Trade Commission in June 1942 the Joseph Triner Corporation Chicago agreed to cease representing that the wine will cleanse the stomach, prevent colds and relieve insomnia, headaches, irritability or nerve disease and that the tonic will clear the system of accumulated poisons, restore appetite and digestion, assure sleep and maintain good health. The concern further agreed to cease representing by use of the word "tonic" in the title or the first named product that it is a general tonic and to discontinue advertisements of these products which failed to reveal that there is potential danger in their use when abdominal pain, nausea, vomiting or other symptoms of appendicitis are present unless such caution appears on the labeling in which case the advertisement needs only to warn "Caution: Use only as directed."

**Yoghurt Ferment Capsules**—This preparation is designated to be combined with milk to form Bulgarian milk and is put out by Yoghurt Products Inc., Seattle. A stipulation which that concern signed with the Federal Trade Commission in July 1942 contained the following provisions: that the advertising would no longer represent that the product in question is of itself Bulgarian milk or that the fluid which results from its mixing with milk is healing, purifying or life-renewing or that it purifies the blood or energizes organic activities that it builds the body or enables the user to get well, keep well or stay young that it destroys disease breeding bacteria, arrests abnormal fermentation or decomposition or restores or produces digestion or a rational appetite and eliminates toxic poisons.

SUDDEN DEATHS AFTER USE OF  
MERCURIAL DIURETICS

*To the Editor*—In the July 25 issue of *The Journal* appear a series of circular reports and an enlightening editorial relative to the sudden deaths following the intravenous administration of mercurial diuretics.

Since my work on "speed shock" and the slow intravenous drip, in 1931, I have been intensely interested in the problem of reactions and I ask your leave to comment on the present situation.

I do not think it is sufficiently stressed that these fatalities resulted from a technical cause rather than from the drug itself. This conclusion is borne out by several considerations: 1. Death occurred mostly, if not exclusively, from intravenous injection. 2. Death or the fatal reaction occurred usually within a few minutes after the injection, so that the accident could not have been due to a specific pharmacodynamic action of the molecule itself. 3. So many of the patients had had previous injections that idiosyncrasy to the drug could be eliminated as a provocative factor.

The animal experimentation, despite its splendid execution, is truly not pertinent to the clinical problem. There is a vast difference between intravenous reactions in the decompensated cardiac invalid and those in a healthy laboratory animal. The authors of the articles and the editorial commentator both stressed the moribund condition of many of the patients, and this must be taken into account in discussing the present situation.

I am reasonably certain that the fatal reactions observed are identical with those described as "speed shock." It is true that the clinicians attest slow injections and in certain instances used diluted solution in a gravity drip. The experimenters controlled the speed of injection clearly in their protocols on healthy cats.

However, the syndrome of "speed shock" exists under certain conditions for what would appear to be relatively slow injection. What is a slow injection in a given situation may be an overwhelming administration of a mercury molecule in a decompensated cardiac invalid.

Conscious of this, in our original work Hirshfeld, Wanger and I noted that "We do not believe that any single rate [of injection] can cover all drugs. For obviously hypertonic solution should be given slower than isotonic and larger molecules slower than small molecules. Toxic substances such as copper sulfate must be given intermittently as well as slowly if they are to be given at all" (*Arch. Int. Med.* 47:286 [Feb.] 1931).

My view of the identity of the reaction causing these mercurial deaths and the syndrome of "speed shock" is susceptible, I believe, of proof. If I am correct, the freshly drawn blood after death should be rendered incoagulable and I urge clinicians to make this simple observation should any one experience again this unfortunate accident.

More important, however, are the broader conclusions relative to the present circumstances and their interpretation. These may be summarized briefly:

1. The reactions immediately following the intravenous injections of a mercurial in a decompensated cardiac invalid are technical and not pharmacodynamic.

2. The reaction resembles, if it is not identical with, the syndrome of "speed shock," in which the blood is rendered non-coagulable.

3. Under the prevailing conditions the reaction may not be averted by a slow intravenous injection of a diluted dose, as in the instance of copper sulfate experimentally.

4. The reaction is averted by intramuscular injection. The great boon of mercurial diuresis must not be withheld through these unfortunate technical reactions which are independent of the pharmacodynamics of the drug.

HAROLD THOMAS HYMAN, M.D., New York

## "CONSERVATION OF MEDICAL SUPPLIES"

*To the Editor*—I have just read with a great deal of interest the article in the August 1 issue entitled "Conservation of Medical Supplies." I want to tell you how timely I think this article is and to express the hope that you will publish more of them.

I am here on leave of absence from my job as administrator of the Albany Hospital to act as head hospital consultant to the War Production Board.

I am quite sure that most of our hospitals are not yet aware of the seriousness of the war situation and the necessity of doing more than we have ever thought possible to conserve critical materials for our armed forces.

Hospitals and their staff physicians must exercise all the native ingenuity which they possess to learn how to do things without many of the semiluxuries which they have thought to be necessary in the past.

When hospitals do apply to the War Production Board on form PD-1A or PD-200 for things which after careful thought they feel they cannot get along without, please warn them to read the instructions carefully and fill these forms out completely.

It will always be wise to accompany their application with a rather detailed letter of explanation so that the case will be as clear to us as it is to them.

Yours for Victory!

MAURY MAVERICK,  
Chief, Bureau of Governmental Requirements  
By E. W. JONES,  
Head Hospital Consultant  
Washington, D. C.

RUBBER FROM RUBBER GLOVES NOT A  
PROTECTIVE AGAINST MUSTARD GAS

*To the Editor*—It has come to my attention that many physicians are instructing gas defense workers to the effect that surgical rubber gloves are to be used as protection against mustard gas. This should be corrected, as it may lead to unpleasant consequences.

This particular grade of rubber is not only an inadequate protection but even accentuates mustard gas burns as well as permanently contaminating the rubber itself. Mustard gas is soluble in the rubber, and a droplet that would produce only a small blister on bare skin may spread through an entire glove, in time, and burn the whole surface.

Of course, if no other protection is available, a rubber glove can afford protection for a short time, but the limitations should be recognized.

Mustard gas will not burn the skin rapidly, and even wiping with a cloth is often ample protection, or rubbing the skin with damp earth is an efficient method if no other is available.

I was an officer in the Chemical Warfare Service Experimental Station at American University in 1918, where I had an opportunity to see numerous demonstrations of the sad results of this particular error.

The fact that rubberized fabric is used in gas masks has probably helped to keep alive this fallacy. But the gas mask is of an entirely different grade of rubber, is much thicker and is not in direct contact with the skin.

C. I. REED, PH.D., Chicago

Professor of Physiology, University  
of Illinois College of Medicine

## SACCHARIN

To the Editor—In THE JOURNAL of July 25, page 1028, there is a mild comment on the harmlessness of saccharin. Many physicians are not fully aware of its nontoxic nature and are fearful about permitting its indiscriminate use.

In 1916, as a member of the Advisory Council of the New York City Board of Health, I was chairman of a saccharin committee composed of noted chemists such as H C Sherman and W J Gies. We made an extensive study of the domestic and foreign literature then available, which was considerable, and came to the conclusion that saccharin is nontoxic, either acute or chronic, for human beings, in any amounts that could ordinarily be consumed. We found an extensive use of saccharin in canned goods, chewing gum, soda water flavors, ginger ale, and so on.

For Health Department purposes we concluded that "Saccharin is nonpoisonous. When used in place of sugar, saccharin is an adulterant in that its use substitutes a substance of no food value for one of definite food value."

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Osteopathy Registration of Osteopaths Under Harrison Narcotic Act, Lawful Scope of Osteopathic Practice**—In a Kansas case, osteopaths were refused registration under the Harrison Narcotic Act, and the Kansas State Osteopathic Association, Inc., and certain licensed osteopaths commenced an action against the United States collector of internal revenue to compel registration. The trial court gave judgment for the osteopaths and the collector appealed to the United States circuit court of appeals, tenth circuit.

The issue in this case, said the court, was whether or not osteopaths under the laws of Kansas have the right to administer narcotic drugs, and that issue must be determined by the state law as construed by the Kansas courts. On three separate occasions, the court pointed out, the Supreme Court of Kansas has had the opportunity to define the limits within which osteopaths may practice and in each instance reached the conclusion that osteopathy was a drugless, manipulative system of healing. The plaintiffs in this action contended, however, that, since osteopaths in Kansas are authorized to practice osteopathy as taught and practiced in the legally incorporated colleges of osteopathy of good repute, they are entitled to use narcotics if instruction in their use is given in such schools. But, the court said, merely studying the use of narcotics in school does not authorize an osteopath to use them in his practice for "the fact that in an osteopathic college the broad principles of medicine and surgery were investigated and considered, merely for the purpose of giving the student body a knowledge of what those who practice medicine and surgery believe, would not be sufficient to conclude that those licensed to practice osteopathy would have the right to practice medicine or surgery."

The plaintiffs further contended that under the court decisions in Kansas osteopaths were precluded from using drugs as "remedial aids" but not from using them for palliative purposes. The circuit court of appeals, while admitting that the term "remedial aids" as used by the Supreme Court of Kansas was ambiguous, pointed out that judges are not skilled in the science of medicine nor in the intricate and delicate shades of meaning of medical terms. When the osteopaths were licensed to practice in Kansas, the court continued, their therapy was designed to relieve pain and other illness by means of manipulation and without the use of drugs, as indicated by statements from their leaders. It was on the strength of that claim that the legislature granted them the privilege of practicing. It they have now found that their osteopathic therapy will not relieve pain and that they must use narcotics or other drugs to effect that relief, that need should be addressed to the legislature rather than the courts. The circuit court of appeals concluded, therefore, that since the laws of Kansas prohibited the use, sale or distribution of narcotic drugs for any purpose by an osteopath, such practitioners were not entitled to registration under the Harrison Narcotic Act. The judgment of the lower court was reversed and the cause remanded, with instructions to dismiss the bill.

In a Nebraska case, the attorney general filed a suit to enjoin the defendant osteopath from practicing medicine and operative surgery and from publicly professing to be a physician, surgeon or obstetrician. Judgment was entered for the defendant in the trial court and the attorney general appealed to the Supreme Court of Nebraska.

The character and general duties of occupations classed as professions are to be determined as questions of fact of which judicial notice will be taken, said the Supreme Court. Whether a specific act constitutes the practice of osteopathy is not therefore subject to proof by expert witnesses. Furthermore, the general rule of pleading which admits as true all facts well pleaded on the filing of a general demurrer or a motion for a

judgment on the pleadings has no application to the facts of which a court may take judicial notice, and such demurrer or motion does not therefore admit a conclusion of law deduced from such facts. An osteopath is defined by the laws of Nebraska as a person who treats human ailments "by that system of the healing art which places the chief emphasis on the structural integrity of the body mechanism as being the most important factor for maintaining [maintaining] the organism in health." He is authorized "to practice osteopathy in all its branches, as taught in the osteopathic colleges recognized by the American Osteopathic Association." To determine the meaning of the term osteopathy the court resorted to the definitions and descriptions of it given by the founder of the practice, by those who teach and practice it, by the lexicographers and by the courts and concluded that the system of osteopathy as thus defined and described does not embrace the use of drugs or the use of a knife. The defendant argued, however, that since general surgery, orthopedic surgery, anatomy, pathology and other subjects are included in the required course of study in an accredited school of osteopathy, their practice is included in the statutory authorization. The court said that the words of the statute are not subject to the construction that they authorize an osteopath to practice everything that is taught in an osteopathic school. The statute contains expressions which have a limiting as well as an authorizing effect. The practice authorized must be osteopathic and it must also be taught in accredited osteopathic colleges. The fact that branches of medicine and surgery may be taught to increase the knowledge of the student in the anatomy and functions of the various parts of the human body for the purpose of better fitting him to practice osteopathy will not warrant him in invading those fields on the theory that they constitute the practice of osteopathy. The scope of osteopathy, the court pointed out, is well known and schools or colleges of osteopathy must stay within its boundaries, they cannot enlarge them. An osteopath's knowledge must be broader than his practice, he must know what he practices but may not practice all he knows.

The fact that the defendant's license used the description "osteopathic physician and surgeon" did not authorize him to engage in operative surgery, in the opinion of the court. The word surgery when used in connection with osteopathy means surgery by manual manipulation and was never meant to include operative surgery. The practice of osteopathy and operative surgery have long been recognized as two separate and distinct things. The further fact that the law under which the defendant received his license provided that "osteopathic physicians shall perform only such operations in surgery as was fully taught in the school or college of which the applicant is a graduate at the time of his attendance" did not constitute a legislative recognition that operative surgery is a branch of osteopathy. Here again the court said that the word surgery must be construed as referring to operations in surgery consistent with the practice of osteopathy as originally defined, which excludes the practice of operative surgery in its commonly accepted meaning. The defendant urged, however, that the principles of osteopathy have changed and that experience and learning have produced certain advances that must be recognized. If osteopathy has changed merely by a self-serving attempt to broaden its scope by invading fields requiring a different license, the court remarked, the legislature of Nebraska has never recognized any such additions to the profession. If the changes have been the result of advances in the profession, they still constitute the practice of osteopathy. But the practice of operative surgery by an osteopath constitutes an invasion of the field of the physician and surgeon as it is generally known and is not an evolutionary advancement of the profession of osteopathy.

As to the practice of obstetrics by osteopaths, the court pointed out that the right to engage in such practice was not specifically granted by the statute authorizing the licensing of osteopaths. It was not disputed that the defendant graduated from an accredited school of osteopathy in which obstetrics was taught. The defendant was also required to pass an examina-

tion in that subject. In this respect in the opinion of the court, the defendant was in no better position than he was as to the right to practice operative surgery. The court felt required, however, to examine the laws of Nebraska to determine to what extent it may, they have modified this position. Under the provisions of an act passed in 1901, an osteopath was required to report births to the proper authorities. A similar provision was continued in the 1905, 1909 and 1919 revisions of the osteopathic act. In 1927 the specific requirement that an osteopath must file a birth certificate was deleted, but another law provided that a birth certificate must be filed by the "physician" in attendance. While in the opinion of the court the fact that the defendant was required to have pursued a course in obstetrics and to have passed an examination in the subject would not alone authorize him to engage in the practice of obstetrics, yet, when considered in connection with the law requiring the reporting of births, there was evident a legislative recognition that obstetrics constitutes a branch of osteopathy, that the use of the word "physician" in the 1927 law relating to the reporting of births was intended to include regularly licensed osteopathic physicians and that osteopaths could therefore engage in the practice of obstetrics.

With respect to the use of anesthetics by an osteopath the act of 1919 under which the defendant was licensed specifically authorized a licensee to use anesthetics, antiseptics, antidotes for poisons and narcotics for temporary relief of suffering. A revision of this act in 1927 eliminated this specific authorization and conferred on osteopaths in general terms the right to practice osteopathy in all its branches as taught in the osteopathic colleges recognized by the American Osteopathic Association. The court did not think that the 1927 revision manifested any legislative intent to deprive the defendant of his previously acquired privilege to use the drugs named. The court was inclined to feel that when a legislative act grants a privilege, a subsequent enactment will not be construed to deprive the beneficiary of that privilege unless a legislative intent to do so is clearly apparent from the legislation itself. The court held, therefore, that the defendant was entitled to use anesthetics by virtue of his license to practice osteopathy.

The court concluded that the trial court erred in not granting an injunction restraining the defendant from engaging in the practice of operative surgery and from publicly holding himself out as licensed and otherwise qualified to perform operative surgery with surgical instruments. In all other respects the judgment of the trial court was held to be correct.—*Burke, Collector of Internal Revenue v Kansas State Osteopathic Association Inc*, 111 F (2d) 250 (1940), *State ex rel Johnson Atty Gen v Wagner* 297 N W 906 (Neb 1941).

**Malpractice Keratitis Attributed to Failure to Remove Foreign Particles from Eye**—On July 31, 1937, the plaintiff sustained an injury to his eye caused by a piece of cement which fell from the ceiling directly above where he was working. Some of the small particles of cement apparently remained in the eye. A few days later he went to the office of the defendant physician for treatment. He continued working until August 20 when without again consulting the defendant he left on a pleasure trip. The eye continued to cause him pain and on October 28 while visiting in another state, he consulted an optometrist complaining of frontal headaches. The optometrist did not make an ophthalmoscopic examination but found the eye and vision to be normal and instructed the plaintiff to return in ten days. The plaintiff did not comply with this instruction and returned to his home state about November 1. He testified that his eye was still giving him trouble at that time but that he did not again report to the defendant physician until November 22. At this time some controversy arose between the plaintiff and the defendant because the latter had considered the case closed as the plaintiff had not returned for further treatment and the defendant had already submitted a statement for his services, which had been paid, this being a workmen's compensation case. Attributing the condition of his eye to a failure on the part of the defendant

to remove all of the particles of cement from it, the plaintiff sued the defendant for malpractice. The trial court directed a verdict in favor of the physician and the plaintiff appealed to the Supreme Court of Colorado.

All of the physicians who treated the plaintiff during the six months following his last visit to the defendant agreed, said the Supreme Court, that the eye trouble was due to keratitis, but none of them discovered any foreign particles in the eye until June 5, 1938, ten months after the accident, and the then examining physician could not identify the foreign bodies. There was testimony to the effect that between Aug 5, 1937 and June 5, 1938 the plaintiff did have other foreign particles in his eye, on at least two occasions. There was no testimony in the record to indicate that any foreign particles which may have gotten into the plaintiff's eye at the time of the accident remained there after his visit to the defendant on August 5, and even if they had so remained, the court observed, the expert testimony was to the effect that keratitis was not caused by trauma but rather was a systemic infection. The undisputed testimony was that the plaintiff's eye condition showed striking improvement while he was being treated on the theory that the disease was due to a systemic infection and during the time concerning which his principal witness testified that there were foreign particles in the eye. This same witness also stated that, if keratitis did not develop within three months after the occurrence of the trauma, trauma would have to be ruled out as a cause.

Without any evidence of the presence of cement particles in the eye after the plaintiff's visit to the defendant, the jury, in the opinion of the court, would have been left entirely to conjecture as to the cause of the condition of the eye, and while the one principal witness for the plaintiff indicated a possibility of a causal relationship he stated emphatically that he had never stated that the defendant caused the keratitis. Even assuming that there was such a causal relationship as the plaintiff contended, the court said that it would be impelled to hold that he the plaintiff was guilty of contributory negligence as a matter of law if his statement was accepted as a fact that although dissatisfied with his treatment on August 5 he did not consult another physician for nearly three months thereafter. The court therefore affirmed the judgment for the defendant.—*Hanley v Spencer*, 115 P (2d) 399 (Colo, 1941).

**Medical Practice Acts Revocation of License for Fraud and Deceit**—The Florida State Board of Medical Examiners revoked the petitioner's license to practice medicine on the ground that he had been guilty of fraud and deceit in his application for a license. The revocation order was reversed in the circuit court and the board appealed to the Supreme Court of Florida.

The charge presented to the board alleged that the petitioner, in his application for a license, stated 'That I have never, or will never, procure or aid or abet in procuring a criminal abortion and in the event I am ever called to attend a case or abortion or miscarriage I will call a reputable consultant to advise with me' when at the time he knew that in 1927 the California Board of Medical Examiners had adjudged him guilty of performing criminal abortions. The charge, said the Supreme Court, was insufficient in that it did not allege that the petitioner had been guilty of. The procuring or aiding or abetting in procuring a criminal abortion—one of the grounds for revocation set forth in the medical practice act, but instead alleged that the petitioner 'had been adjudged guilty of performing criminal abortions by the California Board of Medical Examiners of California about June 29th 1927'. We cannot hold continued the court, that such allegation constitutes a ground for the revocation of a physician's license under the medical practice act. The court then pointed out however, that it was not contended that proof had been made in this case that the petitioner had been guilty of the act denounced by the statute. The contention was that the petitioner committed a fraud on the state board of medical examiners when he procured his license in the state without advising the board of the

action theretofore taken by the California board. The court said that there was nothing in the statutes or in the application adopted by the board which required the petitioner to make such matter known, unless he had been guilty of the act denounced by the statute. Fraud cannot be inferred or deduced from the nonperformance of acts which by law the petitioner is not required to do whatever may be his motive, design or purpose either in doing or not doing the acts complained of.

In the Florida State Board of Medical Examiners had had before it the record of the evidence taken and acted on by the California board, the court said, and, on consideration of that evidence, had found the petitioner guilty, such finding could possibly have been upheld. But here the Florida board assumed to act on the conclusions reached by the California board. If there had been a judgment of a California court of competent jurisdiction, the court continued, adjudging the petitioner guilty of the offense, copy of such judgment properly authenticated would have been entitled to full faith and credit and would have set at rest the question of guilt.

From an inspection of the whole record, the court failed to find that in the original application for a license the petitioner had made any false statements and therefore held that no reversible error was disclosed. Accordingly, the judgment of the circuit court was affirmed—*State Board of Medical Examiners v. Morlan*, 3 So. (2d) 402 (Fla., 1941).

**Charitable Hospitals Liability for Taxes**—A Maine law exempts from taxation the property of benevolent and charitable institutions incorporated by the state, with a proviso that "so much of the real estate of such corporations as is not occupied by them for their own purposes shall be taxed in the municipality in which it is situated." In the *Calais Hospital* case, the hospital was incorporated in 1938 as a charitable and benevolent institution. In 1939 a real estate tax was assessed on the property of the hospital, and after the assessor had refused to abate the tax the matter came before the Supreme Judicial Court of Maine.

The defendant conceded that the hospital was in its legal conception charitable. It was contended, however, that not all of the hospital building was occupied by the hospital for its own purposes and that the portion not so used was taxable. The basis of this contention was that a room in the hospital building was used by a physician as his office in connection with his private professional practice for his personal gain and that this constituted the dominant use of that portion of the property and thus subjected that portion to taxation. The evidence showed that the physician was the treasurer and manager of the hospital and that the room constituted his headquarters in connection with his services to the institution, that there was no setting aside of the room for his exclusive personal use and that it was a matter of mutual convenience, enabling the physician to continue the practice of his profession without detriment to hospital service and of advantage to the hospital because of the greater facility afforded the physician with reference to the performance of his managerial duties. The physician received no compensation from the hospital and the hospital received no rental income.

An arrangement as to the use of one room in the building which benefited the institution in carrying forward its work without additional expense and segregated no portion to the exclusive use of another but left the hospital in dominant control did not, in the opinion of the court, constitute a use which was independent of and alien to the normal functions of the hospital even though it was also of advantage to the physician. In the opinion of the court, there was sufficient evidence that the hospital was incorporated and conducted as a charitable and benevolent institution and that there was an actual appropriation of all its property for its own purposes. The court therefore held that the real estate tax should not have been assessed and entered judgment in favor of the hospital.

In a second Maine case, the Supreme Judicial Court held that a vacant lot owned by a hospital on which it was intended to construct a nurses' home and solarium but which at the

present time was not in actual use except as patients and nurses walked thereon and occupied chairs under the trees was "occupied for its purposes" by the hospital within the meaning of the Maine statute and was therefore exempt from taxation—*Calais Hospital v. City of Calais*, 21 A. (2d) 489 (Maine, 1942), *Osteopathic Hospital of Maine, Inc. v. Inhabitants of City of Portland*, 26 A. (2d) 611 (Maine, 1942).

**Malpractice Chiropractic Treatment of Epilepsy, Discontinuance of Drug Therapy**—In this case the plaintiff sued the defendant chiropractor for malpractice. The trial court instructed the jury to return a verdict for the defendant at the close of the plaintiff's evidence and entered judgment on that verdict after overruling a motion for a new trial. The plaintiff thereupon appealed to the Court of Appeals of Ohio, Hamilton County.

The plaintiff had been afflicted with epilepsy for twenty years or more. It was a type the cause of which was unknown, and there was no known cure. The use of phenobarbital, however, which had been used by the plaintiff for many years, reduced the frequency and the intensity of the convulsions. The plaintiff became dissatisfied with the palliative treatment and sought a cure from the defendant chiropractor. In going to the chiropractor, the court pointed out, the plaintiff manifestly did so for chiropractic treatment. He received that treatment from the defendant, who manipulated his spinal column. There was no claim that the manipulation resulted in any harmful effects. It was asserted, however, that the discontinuance of the use of phenobarbital resulted in the convulsions being more frequent and more intense and that the discontinuance of the drug was by direction of the chiropractor. But, the court pointed out, the plaintiff knew when he went to the defendant that chiropractors did not believe in the curative quality of drugs and relied solely on manipulation to accomplish beneficial results. It seemed to the court, therefore, that the plaintiff submitted voluntarily to the discontinuance of the use of phenobarbital with full knowledge of the consequences in the hope that the chiropractic treatment would effect a cure and that the familiar principle of the common law *volenti non fit injuria*, or to the consenting no injury is done, prevented a recovery of damages for the added suffering resulting from the discontinuance of the drug. The judgment for the defendant was therefore affirmed—*Kirschner v. Keller*, 42 N. E. (2d) 463 (Ohio, 1942).

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 15 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending, but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

**Effect of Tourniquets on Acute Cardiac Crises—**According to Kountz and his associates, rapid lowering of venous pressure by phlebotomy may bring about pronounced relief and rapid recovery of myocardial function in acute cardiac dyspnea. Phlebotomy has been hailed as a life saving procedure in left ventricle failure, especially in the presence of venous engorgement. Danzer thought that a similar effect might be obtained by the application of pneumatic tourniquets to the extremities, utilizing the peripheral venous system as a reservoir to decrease the circulating blood volume. He reported a dramatic relief of symptoms from this procedure in some cases of acute cardiac failure. Advantages of the method over venesection are self evident. More blood can be removed from circulation by utilizing the peripheral venous tree as a reservoir than would be desirable by bleeding alone. Another advantage is that a large quantity of blood may be retained 'in storage' for a long time. There is the disadvantage that it tends to cause venous dilatation and thus might favor venous thrombosis and possibly emboli. The authors studied the effect of peripheral venous congestion in normal persons and in a group with heart disease by means of an instrument which inflated and deflated cuffs placed on the arms and thighs in rotation. In both groups rhythmic inflation of the cuffs caused a fall in venous pressure, diminution of cardiac contraction and a fall in cardiac output; the arterial pressures remained essentially unchanged. In normal persons some enlargement of the heart occurred during rhythmic constriction of the extremities; in patients with hypertensive heart disease the size of the heart usually remained unchanged, but in 2 instances the heart diminished slightly in size. The procedure may be useful in the treatment of acute myocardial infarction as well as in paroxysmal cardiac dyspnea. It appears to be of no benefit in right ventricular failure.

**Hemolytic Transfusion Reactions—**Wiener and his co-workers describe a test to be employed in cases in which the possibility of intragroup incompatibility is suspected. One hundred cc of the prospective donor's blood is mixed with 10 cc of 3.8 per cent solution of dihydric sodium citrate, 10 cc of blood is drawn from the patient and divided between two tubes, one empty and the other containing 1 cc of the citrate solution. Through the same needle 50 cc of the donor's blood is injected by syringe into the patient. After one hour 10 cc of blood is again drawn from the patient and treated in the same way as the pretransfusion sample. The citrated blood samples are centrifuged at once and the color of the plasma in the two tubes is compared. The serums from the clotted blood samples are later separated, this serves as a check on the results of the citrated samples of blood. If there is no change in the appearance of the patient's plasma and the need for blood is urgent, a large transfusion can be given. If time permits it is preferable to inject another test dose of 50 cc of the donor's blood and to draw a third sample of blood from the patient after an additional hour. In this way more reliable results can be obtained. The reaction in positive cases is more striking, in one hour after the test injection of 50 cc of blood the patient may have a severe chill and a rise in temperature, but more reliance is to be placed on the appearance of the patient's plasma, which will show a distinct rise in the icteric index as compared to the pretransfusion sample. If only bank blood is available, no sample more than three days old should be used.

**Etiology of Acute Pancreatitis—**Popper made enzyme determinations on aspirated gallbladder bile from 164 patients operated on for gallbladder disease and from 36 operated on for other abdominal disease. In the latter group a normal bile system was found at operation. Pancreatic enzymes were present in the bile in 10 per cent of all cases suggesting that

in these a common channel was present through which pancreatic reflux into the biliary system was made possible. He has tried another approach to this question by analyzing bile from 18 patients with acute pancreatitis for the presence of pancreatic enzymes. In 16 pancreatic enzymes were found in the bile. Evidence for the existence of common channel formation between bile and pancreatic ducts was thus present in 89 per cent of the patients with acute pancreatitis. A reflux of pancreatic juice into the bile passages was found in 3 with normal bile passages. Evidence of a common channel was present in mild pancreatitis as well as in pancreatic necrosis, indicating that the different types of acute pancreatitis may be caused by the same pathogenic mechanism.

**Vitamin Survey of Normal Industrial Workmen**—Schmedert and his co-workers report the results of a vitamin survey of 1265 healthy men 20 to 65 years of age engaged in industrial labor. Only 1 man was found to have had rickets during childhood. A detailed dietary and symptomatic history revealed that 24 of 300 had a diet inadequate in vitamin A. However, no instance of subclinical vitamin A deficiency was observed. There were no instances of xerophthalmia, night blindness or hyperkeratotic cutaneous papules. No crises of muscular pains, paresthesia and polyneuritis suggesting vitamin B<sub>1</sub> deficiency were seen. Gastrointestinal symptoms (gas, heartburn and dyspepsia) were reported by 52 of the 300 questioned, but none were severe enough to cause a defective vitamin B absorption, nor could they be conclusively attributed to vitamin B<sub>1</sub> deficiency. Pigmented dermatitis, soreness of the mouth, redness of the tongue, indigestion, diarrhea and disturbances of the central nervous system suggesting subclinical pellagra were not observed. Cheilosis and conjunctivitis characteristic of riboflavin deficiency were not noted. Blood plasma ascorbic acid determinations on 78 of the normal workmen revealed only 13 with a level of more than 0.75 mg per hundred cubic centimeters, while 64 per cent had a plasma level of less than 0.5 mg. The blood plasma ascorbic acid level correlated with the dietary intake of vitamin C. None showed any signs or symptoms of vitamin C deficiency and all were in good health and able to do industrial work. These observations indicate that plasma ascorbic acid saturation is not necessary for good health and that signs of scurvy will not develop even with plasma levels ranging from 0.1 to 0.5 mg. There is no well controlled experimental evidence on human subjects which proves that tissue and plasma ascorbic acid saturation is necessary for normal good health. Amounts smaller than the 60 to 80 mg of vitamin C advocated appear to be compatible with good health. The increasing reports on the widespread prevalence of vitamin deficiency disease and its deleterious effect on health should not be viewed with too great alarm.

**Active Immunization for Pertussis and Diphtheria**—Kendrick reports results of active immunization of 4,212 children against pertussis with vaccine. The value of alum precipitated vaccine has been compared with the "standard" pertussis vaccine and with combined pertussis vaccine and diphtheria toxoid. The results indicate a good degree of protection against pertussis following a dosage schedule of 30 billion organisms distributed in three injections over five weeks. They appear similar to those in which 70 billion organisms were injected over three weeks. The observations suggest that the period over which the vaccine is administered should receive as much consideration as the total dosage. Good antigenic response, demonstrated by immunologic tests, followed the use of alum precipitated vaccine and pertussis vaccine combined with diphtheria toxoid. An interim tabulation on incidence indicates protection against pertussis following the injection of the combined antigen. The tabulation reveals an attack rate of 0.7 per hundred person-years in the combined vaccine group in comparison with 1.6 in the standard vaccine group and 10.9 in a control group. A single, relatively small injection may provide an adequate secondary stimulus just before the child enters school.

**Sensitivity to Coccidioidin**—Recent studies indicate that coccidioidomycosis may be more widespread than is generally believed. Aronson and Gallagher made a survey of 680 students at an eastern preparatory school. The students, aged from 13 to 19 years, were simultaneously tested with 0.01 mg of old tuberculin of known potency and with 0.1 cc of a 1:100 dilution of coccidioidin. Individuals negative to 0.01 mg were subsequently tested with 1 mg of old tuberculin. There were among these students 10 from Texas, 9 from California, 1 from

Arizona and 1 from New Mexico. Twenty-six per cent were positive to 0.01 mg of old tuberculin, and an additional 27 per cent were positive to 1 mg, while 17, or 25 per cent, reacted to 0.1 cc of a 1:100 dilution of coccidioidin. The coccidioidin test was repeated on the 17 students three months later with the same preparation of coccidioidin, the reactions of 13 were similar and those of 4 were less definite. A questionnaire sent to the parents of these 17 boys revealed that 9 had lived in or visited one or more of the Southwestern states. Only 8, or 12 per cent, of the 659 boys with no history of residence in the Southwestern states reacted to coccidioidin. Of the 17 boys who reacted to coccidioidin, 12 failed to react to the intracutaneous injection of 0.01 and 1 mg of old tuberculin. Five of these 12 gave no definite medical history of coccidioidomycosis, although on roentgen study they showed definite calcified nodules well out in the pulmonary fields and in the hilar area, 4 of this group had at no time visited or lived in the Southwest. Of the 17, 2 gave a history of an illness suggestive of coccidioidomycosis. The protean manifestations and the variable severity of infection with *Coccidioides immitis* made it difficult to determine whether or not any of the 17 boys have had clinical evidence of coccidioidomycosis. All of them at one time or another have had an illness resembling influenza or grip, which in some instances may well have been due to *Coccidioides immitis*.

**Tumors of Acoustic Nerve.**—Tumors of the acoustic nerve account for 8 to 9 per cent of all intracranial neoplasms. As a rule they develop in patients during their third decade, although no age is immune. They are rarely found in persons more than 50 and, if found in a young person, are usually associated with neurofibromatosis. If bilateral they are associated with central or generalized neurofibromatosis and often show a familial tendency. Schwartz discusses roentgen examination of a patient suspected of having a tumor of the acoustic nerve. The examination must be complete and must be carefully correlated with the history and clinical signs. The examination consists of stereoscopic films of both sides of the head in the occipital, the semilateral, the nose-chin and the brow-nose positions. The tumor usually originates in the canal close to the internal auditory meatus. The walls of the canal may show slight atrophy, which would be the earliest roentgen evidence. This atrophy must be real. The cortex must show demineralization to be atrophic. The next phase in the development of the tumor is the enlargement of the internal auditory meatus with atrophy of its walls, followed by emergence of

the tumor from the canal and the production of a notchlike defect in the petrous ridge. Later, an encephalogram may show distortion, obliteration or even a cystic enlargement of the homolateral portion of the cisterna ambiens and of the aqueduct. Sufficient pressure may be transmitted to produce a slight homolateral atrophy of the dorsum sellae, particularly if this structure is of the type susceptible to atrophy. The last stage, when the tumor is large, is characterized by all the foregoing changes and evidence of increased intracranial pressure. The cortex of the interconvolitional ridges and the bone covering the ridges must be really atrophic to be due to pressure. The pineal gland may be displaced by the tumor. Unfortunately the development of all such tumors is not true to form. Not infrequently a tumor is found which produces little or no bony change until the stage of increased intracranial pressure is reached. In such a case a relatively early diagnosis would depend on the symptoms, clinical signs and encephalography, showing the usual distortions of the cerebral fluid spaces produced by a tumor in the cerebellopontine angle. A tumor of the acoustic nerve must be differentiated from a primary epidermoidoma of the petrous pyramid, a meningioma and a glioma of the astrocytic or the oligodendral type. The treatment of these tumors is a complete surgical removal. If a complete removal is impossible or inadvisable, roentgen therapy in large doses may be employed in the hope of inhibiting the almost inevitable growth of any remaining tumor tissue. The tumors contain few mitotic figures and are therefore not radiosensitive.

**Pulmonary Fibrosis After Roentgen Irradiation of Mammary Cancer.**—Leach and his collaborators reviewed the course of 347 patients with operable cancer treated partly or entirely with radiation between 1926 and 1936 inclusive and who are still alive. Roentgenographic evidence of pulmonary fibrosis developed in 77. Ninety-seven patients received preoperative irradiation, and of these 11 were treated with single doses of 500 to 850 roentgens and pulmonary fibrosis developed in only 1, 57 were treated with divided total doses of from 1,200 to 2,400 roentgens and 31 suffered from pulmonary fibrosis, of 31 treated with 4 Gm radium element pack pulmonary changes developed in only 2. Pulmonary fibrosis developed in 7 of 77 patients irradiated postoperatively with massive doses to five fields, usually two cycles of 750 roentgens each, separated by an interval of about three months, but this complication developed in 8 of 41 in whom divided doses were used. When both preoperative and postoperative roentgen therapy was given to 37 in massive doses, fibrosis of the lung developed in 8. Pulmonary fibrosis developed in 12 of 67 receiving roentgen therapy (usually massive doses), interstitial radium and surgery, 8 of the 12 were associated with divided doses of radiation. Fibrosis developed in 7 of the 16 patients treated with radiation alone. The frequency of pulmonary fibrosis appears to be directly related to the large total doses delivered to the lung by divided dose technic and the area irradiated. Age does not appear to be a predisposing factor. The dyspnea in these patients, based on the studies of the alterations of pulmonary physiology, is due to a definite diminution of the vital capacity caused by the fibrosis fixity of the wall of the chest, compensatory pulmonary emphysema and hyperirritable Hering-Breuer reflexes. The dyspnea may be relieved by an abdominal belt, weight reduction or both. The patient's cough improves as the dyspnea decreases.

**Operable Cancer of Breast.**—Bransfield and Castiglano point out that a simple mastectomy is performed in the belief that one is dealing with a local cancer. If this was so the cure rate should be 100 per cent, yet the five year survival rate is only 38 to 50 per cent. The deduction is that the error in such a clinical diagnosis is more than 50 per cent. Therefore, more than 50 per cent of mammary cancers thought to be early and supposedly curable by simple mastectomy have spread beyond the conservative operative field. From 30 to 40 per cent of cancers which have spread beyond the reach of the conservative operation have not progressed beyond the reach of the radical operation. Only about 10 to 25 per cent of cancers when first seen have spread beyond the operative extent of a radical mastectomy. The curability of cancer of the breast is not governed alone by its local character. The authors advocate the radical operation in all stage 1 and stage 2 cancers of the breast.

**Rolandic Vein Syndrome**—Merwarth states that the disturbances of the syndrome of the rolandic vein, resulting from interference with the cerebral venous circulation, have not received concerted clinical attention because of their relative infrequency. The tendency has been to regard the cerebral veins as structures devoid of physiologic importance. The physical symptoms resulting from interruption of the drainage of the rolandic vein form the ideal basis situation for suspecting such interference, especially when previous infection, tumor or trauma has existed in or near the superior sagittal sinus. The principal feature of a venous hemiplegia is symptomatic fluctuation which embraces both the motor and sensory fields. The responses of the patient in the higher fields of intellect are relatively unimpaired. Aphasic and dysarthric speech, usually found in arterial disorders, is absent. Facial paralysis is uncommon. The paralysis is characteristic the lower limb, particularly the foot is paralyzed to the greatest degree. In the upper limb the proximal joints are weakened while the finger and hand movements are usually preserved but, if involved, soon recover. This is in distinct contrast to capsular hemiplegia. Early in the disease the muscle tone on the paralyzed side, which fluctuates widely, is unusually spastic. At one examination the limb may be hypertonic, at another hypotonic. This phase of the illness may be missed completely if frequent examinations are not made. There is no tendency to articular fixation in venous hemiplegia. The deep reflexes are hyperactive early, although if examined during the state of "nonrigidity" they may be diminished. Recovery of motor function, following the motor representation in the rolandic area, is the second prominent feature of venous hemiplegia. The preserved function in the fingers and hand with absence of movement at the elbow, shoulder and lower limb is striking. In time function returns progressively to the elbow, shoulder and lower limb. The last function to recover, if at all, is that of the foot and the toes. The sensory loss is chiefly in the gnostic field, the delayed recovery of which does not parallel the motor recovery. There is a tendency to variation, the observations of two successive examiners may be contradictory. The general prognosis is complete recovery. Thirty-one cases were collected by the author from the literature and from personal communications. When the sinus anterior to the rolandic point was removed in 17 there were 6 in which no postoperative disability was noted. In 3 among the 12 in which portions of the sinus at or posterior to the rolandic point were removed no new postoperative symptoms occurred. The resected sinus showed complete occlusion, suggesting utilization of the available profuse collateral circu-

lation. Although the literature stresses the major emergent clinical, careful analysis shows that it is the tributary cerebral veins which are of basic importance. A study of the reported successes after a portion of the sagittal sinus was removed behind its vulnerable site—the rolandic point—indicates that a previous circulatory adaptation was set up by the profuse venous anastomosis that exists between the terminal cerebral veins and their many interlocking tributaries.

**Surgical Treatment of Peripheral Embolism**—Pratt believes that peripheral embolism should be treated with embolotomy as soon as the diagnosis is made, despite the fact that occasionally neglected patients survive. Many such recoveries are not truly embolic. In the presence of bilateral symptoms, both femoral arteries should be exposed at once. What can be accomplished in an apparently hopeless state is illustrated by a case in which removal of a large saddle embolus sixty hours after its lodgment resulted in a survival and complete restoration of circulation in one limb and in the other to the knee. The right side apparently closed off earlier than the left, perhaps with an additional tibial embolus. The mottling of the left side indicated a beginning arterial failure on the day of the embolism. Collaterals were probably helpful until the next day, when these likewise failed. The recovery in this case indicates that the arbitrary time limit can be successfully modified in most instances.

**Peritoneal Adhesions**—The studies of Seeley on rats, rabbits and monkeys show that stimulation of the peritoneum by sodium ricinoleate imitates nature's processes of healing by producing an abundant exudate rich in neutrophilic polymorphonuclear leukocytes and monocytes from which abundant fibrin is deposited. The presence of this abundant exudate acts as a lubricant to prevent the formation of adhesions. In addition, sodium ricinoleate possesses bactericidal, bacteriostatic and detoxifying properties and by slowing or reversing absorption from the peritoneal cavity assists in combating infection. Sodium ricinoleate is well tolerated intraperitoneally in laboratory animals and in the human being. It is capable of preventing the majority of unfavorable adhesions after drastic trauma to the viscera and peritoneum of animals. Sodium ricinoleate solutions must be freshly prepared in pyrex glassware. Old stock solutions are toxic. Any agent designed to prevent or reduce the number of adhesions must be introduced very early.

**Gold Salts in Treatment of Rheumatoid Arthritis**—Cecil and his co-workers discuss the results of gold salt therapy in 245 cases of rheumatoid arthritis. There were 31 per cent in which complete remission of pain and swelling in the joints occurred and 35 per cent in which there was definite improvement, in all 66 per cent either became inactive or were greatly improved. Early treatment led to even better results, 78 per cent treated early (duration of disease less than one year)

showed either a complete remission or a decided improvement. The percentage of remissions and decided improvement was about the same in the mild and in the severe cases, 67 and 63 per cent, respectively. Seventy-seven per cent of such patients received a total of 1 Gm or more of gold salt, whereas only 41 per cent of those who showed no improvement received such a dose. Three of the 10 patients with ankylosing spondylitis received inadequate treatment. Of the remaining 7, only 1 was improved. Two children with Still's disease were treated with not more than 0.5 Gm of gold salts, 1 has had a complete remission for more than five years and the other child, still under treatment has shown moderate improvement. The sedimentation rate in 47 per cent of those with remissions was normal or only moderately elevated after gold therapy in contrast to only 5 per cent of those who showed no improvement. Age, sex and severity of the disease do not appear to be determining factors. Relapses occurred in 42 per cent of the patients who received definite benefit from gold therapy. The relapses were usually milder than the original attack but yielded less promptly to gold therapy. Remissions lasted more than a year in 52 per cent. The incidence of toxic reactions (exfoliative dermatitis, other cutaneous lesions, stomatitis, gastrointestinal symptoms, jaundice, purpura, granulocytopenia, bronchitis and albuminuria) was 42 per cent. No effective means of preventing or treating toxic reactions has been found.

**Periarteritis Nodosa**—To date 14 proved cases of periarteritis nodosa have been observed at the University Hospital among more than 460,000 admissions. In 7 a correct ante-mortem diagnosis was made. The diagnosis according to Jones, can be demonstrated only by a positive biopsy although a negative biopsy does not rule out the condition. The symptoms are varied, as arteries in any part of the body may be involved. The most common symptoms are referable to the organs most commonly affected. The duration of the illness was closely correlated with the degree of involvement of the vital organs and their resultant dysfunction. The average length of life after the onset of illness was eleven and one-tenth months. The etiology of periarteritis nodosa is unknown, but the close relationship between the disease and previous and concomitant infection is evident. Only 2 of the 14 patients are still alive. Since there is no known treatment and there is so often an associated infection, the trial of sulfanilamide or sulfapyridine seems justifiable until an adequate number of cases have been accumulated from which conclusions may be drawn.

**Neurocirculatory Asthenia**—King emphasizes that, to prevent the acceptance of men with potential neurocirculatory asthenia into the armed forces, the internist and the psychiatrist must work together. The psychiatrist should be expected to recognize potential cases on the basis of intelligence defects, unstable reaction to authority (parental, clerical or other), chronic invalidism, especially referred to the cardiovascular system and emotional instability, sense of inferiority resulting from sex maladjustment, fear of warfare, fear of shirking and the like. The internist should eliminate men with symptoms based on the previous background of recent infections, general physical (constitutional) inferiority, men with demonstrably small hearts, asthenic habitus (with 'ventral' heart) and neurocirculatory sensitiveness (history of abnormal reaction to coffee, tobacco and alcohol may afford a clue). Some exercise test is essential, and that suggested by Meakins and Gunson (the pulse rate after a simple exercise test) seems good. In doubtful cases it may be desirable to apply the epinephrine test. A positive response to the injection of 0.5 cc of a 1:1000 solution of epinephrine consists in a rise of blood pressure of 10 mm or more, a rise in pulse rate of ten or more beats per minute with tremor, nervousness, palpitation of the heart and sweating. Men with positive reactions are unfit for duty and should be rejected. A negative response does not eliminate the diagnosis. The test merely furnishes additional evidence that the subject is poor material for military service.

**Familial Syringomyelia and Status Dysraphicus**—Mulvey and Riely studied several members of three generations of a family, various individuals of which presented signs and symptoms of impaired circulation to the extremities, disturbance of sensation in the lower limbs and feet and, in a few members, similar disturbances in the hands. Slow healing ulcers were

present in the feet of some. Structural anomalies and the so-called stigmas of degeneration were present in nearly all. The person representing the first generation of this family was not examined, but evidence given by members of the second generation reveals that this man had severe disease of the feet throughout the greater part of his eighty-one years of life. Of 14 members of the second generation only 5 are living and of 4 examined 2 are apparently free of the affliction. Of the dead members there is strong evidence that 1 died with gangrene of the feet. In the third generation 7 of a possible 15 individuals have been examined. Six of these 7 members show some degree of dissociation of sensibility in the feet. Some have exhibited changes as high up as the knees. Two have had impairment of sensation in the hands. Loss or decrease of pain and temperature sensibility is the most important neurologic change in these patients. 4 members show some disturbances in the sense of position. All patients in both generations except 2 women in the second generation appear to have been poured from a common mold. All were tall and thin. The hands and feet were narrow and long, the fingers except in 1, were long and slender. All had high arched palates. 2 had a moderate pes cavus and 2 had painless flat feet. The scapulas of all had a definite tendency toward winging. Four of the third generation gave histories suggestive of Raynaud's phenomenon, although attempts to precipitate the symptoms in 1 were not successful. Of the 6 individuals who have had painless slow healing ulcers of the feet 3 gave a history of bone sloughing from these ulcers, 2 a history of self amputation of some of the toes and 1 had had an amputation at the knee joint because of deformities and osteomyelitis. On roentgen study trophic changes were seen in the bones of the feet of 2 patients, and loss of bone structure in the phalanges. In 1 patient a roentgenogram of the lumbar spine disclosed a spina bifida occulta. In 3 patients the onset of menses was late, at 17, 19 and 20 years respectively. In view of the lack of progression, as in a genuinely active syringomyelia and the relatively static nature of the defect that marks this family, it is concluded that the disturbances are due to the presence of a definite constitutional status dysraphicus. Status dysraphicus or faulty closure of the neural tube, early in embryonic life is readily transmitted to offspring as a dominant characteristic.

**Vitalium Tubes in Biliary Surgery**—Pearse cites data from animal experimentation, dissection on cadavers and clinical experience with the use of vitalium tubes in biliary surgery. Injury to the bile ducts, irreparable by other methods has been

treated successfully by the permanent implantation of a vitallium tube. A straight 33 cm. by 6 mm tube with a central flange to anchor it in place is most useful to hold open a strictured area of the common bile duct. Loss of a part of the common duct is best repaired by approximating the ends over a vitallium tube even if tension must be used. This holds the ends of the duct together, and the tube prevents occlusion by stricture. To bridge a gap by tying the tube into the ends of the duct may be dangerous, for it may slip out of place. Injury or stricture of the common hepatic duct within 1 cm. of the bifurcation of the hepatic ducts produces mechanical problems that require specially designed tubes, for this purpose trumpet Y and half Y shaped tubes have been made. Vitallium tubes have been used in the repair of a pancreatic fistula and one has been designed for the palliative intubation of a malignant occlusion of the bile ducts.

**Spontaneous Internal Biliary Fistula**—In a series of five hundred operations for benign disease of the biliary tract Puestow encountered 16 patients with spontaneous biliary fistulas. The duration of symptoms varied from one month to twenty-seven years. A preoperative roentgen diagnosis was made in 2. Seven of the 9 patients with a cholecystoduodenal fistula gave a history of jaundice, 1 of the 2 without jaundice had an obliterated cystic duct and the other 1 had been operated on eighteen years previously and was of the opinion that her gallbladder had been removed. At operation the gallbladder was found to be present and filled with stones. There were 3 deaths among the 16 patients. This is extremely high when compared to the author's mortality of 12 per cent for uncomplicated cholecystectomy. The morbidity of biliary surgery complicated by internal fistula likewise is increased. The average length of hospital stay after operation was twenty-three and five-tenths days compared to twelve and seven-tenths days for all other operations for benign disease of the biliary tract. The time required for the disappearance of jaundice, the return of weight and strength and the ability to return to normal activities was several times that following surgery for uncomplicated biliary disease.

**Bile Duct Reflexes and Anginal Pain**—Ravdin and his associates observed patients with decompensated hearts and chronic auricular fibrillation restored to compensation and a regular cardiac rhythm with no change in the medical regimen following removal of gallstones by cholecystostomy. Long-standing serious heart disease has made patients hopeless invalids by the additional symptoms imposed by a gallbladder containing gallstones or by the presence of stones in the common duct. The authors have encountered a number of patients who were treated for true angina pectoris by competent cardiologists but who were completely free of their supposed anginal attacks after the removal of gallstones, common duct stones or both. Layne and Bergh reported that sudden distention of the common duct in man may cause reflex spasm at the lower end of the common bile duct. Reflexes arising in the extrahepatic biliary passages may at times restrict coronary blood flow and produce symptoms of angina pectoris. The histories of 2 such patients are reported probably for the first time. When the extrinsic factors causing these reflexes are removed, the anginal symptoms disappear. While surgery does not completely relieve the cardiac symptoms, some measure of relief is nearly always obtained.

**Koch Method of Treating Burns**—During the last two years, Siler and Reid have used the Koch method of primary cleansing, compression and rest in the treatment of burns of 134 patients, 90 children and 44 adults. As measured by Berkow's method, less than 15 per cent of the body surface was involved in 39 cases, 15 to 30 per cent in 58, 30 to 60 per cent in 27, 60 to 85 per cent in 9 and 85 or more per cent in 1. There were five deaths, a mortality of 37 per cent. Clinically, 79 had no infection, 15 were mildly infected, 25 were grossly infected and in 15 it is not known whether or not infection was present. There were only a few minor infections in patients with first and second degree burns. No deaths were due to infection, unless the port of entry of the 1 patient with the 85 per cent burn who died fourteen days after operation from streptococcal pneumonia, empyema and suppurative pericarditis was from the burned area. Suffering was strikingly decreased by this method

of treatment. It rarely was necessary to use morphine or codeine for more than a day or two after operation. The patients could move about much more easily. There was a great saving in dressing materials when compared with other methods which require frequent changes of dressings or compress therapy. Temperatures returned to normal levels rapidly. These patients rapidly regained their water balance by oral fluid, parenteral administration was required only in the more severe cases. Solid food was enjoyed early in convalescence. It is the authors' belief that the careful preparation of the wound, under anesthesia, and the long duration of the primary dressing definitely lessened the incidence of infection. The pressure dressing may aid materially in preventing the loss of plasma at the site of the wound and into the surrounding tissues.

**Dinitrophenol and Formation of Cataract**—A sporadic outbreak of more than 164 cataracts, predominantly in young women, which began about April 1935, rapidly increased during the summer and fall and gradually disappeared during 1936-1937 like an epidemic, seemed to point, Horner states, to dinitrophenol as a common source, taken for the rapid reduction of body weight. The cataracts were bilateral and were all of one type, they developed rapidly, were accompanied by visual loss and occurred at any time up to a year after the drug was discontinued. Medical treatment was without effect, but surgical extraction was successful and excellent visual acuity was obtained in a large percentage of cases. Attempts to produce cataracts in laboratory animals have been unsuccessful. The cause of cataracts following treatment of obesity with dinitro bodies is unknown. Further therapeutic use of dinitro drugs is contraindicated, and some other less toxic substitute as an efficient oxidizer of excess body fat may be developed through the knowledge that has accumulated in the study of dinitrophenol.

**Eye Worm Infection in Man**—Hosford and his co-workers report the second case of infection in man with a nematode worm, *Thelazia californiensis*. Helminthologists believe that such infection may occur in man more frequently than is indicated by the recorded cases. Infection with this parasite is presumably rather benign, but trauma of some magnitude may occur. The history of their patient substantiates the opinion that infection is acquired in hilly or mountainous country covered with brush during the summer months. Cocainization of the eye should be avoided when the parasites are removed, as it may tend to be absorbed by the parasites and render them less motile and hence less easily seen. The only damage the worms do in man or in animals is to cause discomfort, excessive lacrimation and in some cases scarification of the cornea with subsequent ulceration. The worms should be searched for on repeated occasions, as it is difficult to be certain that all of them have been removed at a single examination.

**Oxycephaly**—The ocular effect twenty-five years after three cerebral decompressions in a case of oxycephaly suggests to Levine that solely from an ocular point of view it is doubtful whether temporal decompression has any beneficial effect on the ocular system in oxycephaly.

**Common Duct Cyst**—Smith collected 181 cases of cyst or idiopathic cystic dilatation of the common duct from the literature. He reports 2 additional cases from the Presbyterian Hospital found among the records of 757,000 cases. Most of the patients were females under the age of 25. A number were pregnant when the cyst became obvious. The cyst wall frequently consisted of fibrous tissue without a lining epithelium. The condition may be suspected in the presence of a growing tumor of the right upper quadrant of the abdomen in a young female patient with jaundice. It had occurred in young males and in middle aged persons of both sexes and without jaundice. Immediate anastomosis with the gastrointestinal tract may be indicated if the cyst is not too large its identification being positive and the patient's condition permitting such an intervention. The ill effects or the absence of bile from the gastrointestinal tract when complete biliary fistula is established by marsupialization can now be partly relieved by the administration of vitamin K and bile salts or desiccated animal bile. The author's first patient is the first recorded instance in which such treatment was carried out. Each of these cases provides an opportunity for the study of human fat absorption in the absence of bile from the gastrointestinal tract. The literature lacks follow-up reports on the late results of anastomosis of these cysts.

**Hypoproteinemia in Surgical Disease**—Davis and Getzoff classify hypoproteinemia in surgical diseases as prehepatic, hepatic and posthepatic. In the prehepatic type the causative factors are those of inadequate intake, deficient digestion or insufficient absorption of plasma protein building material. Hepatic hypoproteinemia results from the inability of the liver to synthesize plasma proteins despite an adequate supply of precursor material. Extrahepatic infections may result in hypoproteinemia. Another important factor is loss of protein into the site of suppuration. The posthepatic type of hypoproteinemia results from a loss of fully formed plasma protein from the body due to plasmapheresis, hemorrhage, subcutaneous or intraperitoneal injections of bile, burns, trauma and freezing. Protracted loss of blood is an occasional factor. The different forms of hypoproteinemia vary in their response to treatment. In addition to dietary treatment it is usually necessary to administer additional proteins or amino acids by the parenteral route. The available protein and amino acids are whole blood, blood plasma (whole or lyophilized), blood serum (whole or lyophilized), ascitic fluid and digests or casein. Ascitic fluid

may be administered intravenously or subcutaneously, preliminary typing or cross matching being unnecessary. Papain digests of casein given intravenously or subcutaneously have been shown to stimulate new plasma protein production as effectively as protein given by mouth. Administration of amino acids will be effective only if the liver is capable of protein synthesis. Vitamin C should be administered with amino acid as it is essential for the proper metabolism of certain amino acids, phenylalanine and tyrosine.

**Hemostatic Effect of Oxalic Acid**—In the administration of oxalic acid to 440 operative patients, on whom nearly all major operative procedures were performed, Blain and Campbell observed that 1 Cessation of hemorrhage was immediate or there was a noticeable decrease in oozing. 2 A definite measurable reduction in coagulation time occurred. 3 There was no appreciable decrease in prothrombin time. 4 The best clinical results were obtained in cases with much surface oozing. 5 There was no clinically demonstrable renal damage. 6 Thrombophlebitis did not develop nor were there any other untoward reactions. 7 There was an apparent decrease in the amount of serum collecting at the incision. 8 Administration of oxalic acid effectively controlled bleeding associated with carcinoma. It is in the troublesome cases in which definite capillary oozing continues after all bleeding points have been ligated that the effect has been most dramatic. Postoperative sequelae have been favorably influenced, particularly wound infection. Wound infection may occur not only from micro-organisms but also from the collection of blood or serum. Excessive oozing cannot always be anticipated. Because 20 mg of the drug is harmless the authors administer it routinely in certain types of major operation. Patients with jaundice and vitamin K deficiency have not been included in the series.

**Two Unusual Symptoms of Eyestrain**—Noyes has relieved several patients of annoying tinnitus by correcting hyperopia, astigmatism and presbyopia. The relief of eyestrain will not cure all patients of tinnitus, but if the possibility of its presence is carefully considered many patients can be relieved by the correction of refractive errors and muscular imbalance. Globus hystericus is another symptom of eyestrain which is not commonly considered as such. Many such patients have been relieved by properly fitted glasses.

Single Massive Dose of Sulfathiazole for Acute Gonorrheal Urethritis—Pappas evaluated the advantage of a single massive oral dose of sulfathiazole in the cure of uncomplicated gonorrhea, especially in active military operations, by treating 28 soldiers with an acute previously untreated infection and 5 whose disease had not responded to previous sulfonamide therapy. The alleged period of symptoms in 13 of the 28 ranged from one to twelve with an average of four and nine-tenths days, while in the 15 who presented only an anterior urethral infection it averaged one and six-tenths days. A single dose of 5 Gm of sulfathiazole was given to the first 5, 6 Gm to the next 15 and 7 Gm to the last 8. Phenobarbital 0.065 Gm was administered routinely to all patients about half an hour prior to the drug. Fluids, to 4 liters a day were forced for several days following chemotherapy. Twenty-three of the 28 patients while only 2 of the 5 patients who had had prior chemotherapy were cured. Smears became negative for the gonorrheal organism the urethra was dry and the urine of two-glass tests was clear after an average of two and six-tenths six and six and five-tenths days respectively. The average figures indicate that the patients could have been returned to duty in seven and three-tenths days, having been dry for about two days and having had both urines clear on two successive mornings. The author feels that similar results could have been obtained without the patients having lost any time from duty except for the day of chemotherapy. The 5 Gm dose of sulfathiazole appeared to be as efficacious as the higher doses. During a follow-up period of nine months not 1 patient had a relapse. There was one reinfection of a patient who had been asymptomatic for six and a half months. The patients have been classified as cured. The results emphasize by implication that the initial dose of sulfonamides should be high if drug resistant infection is to be prevented. The method promises to be of extreme value in early acute gonorrheal infection particularly during active military operations and in persons who cannot be controlled for even a moderately prolonged course of chemotherapy.

Diagnosis and Treatment of Chronic Gastritis—The past five years have seen a rapid reevaluation of the status of chronic gastritis. According to Jackson and his associates, the clinical syndrome ranges widely and often embraces many generalized and vague abdominal symptoms. The complaint frequently includes generalized upper abdominal distress, nausea, pyrosis, anorexia, loss of weight, constipation and the like. The symptoms often center about vague or mild midabdominal or upper abdominal pain, gassy distress, a feeling of epigastric fullness, pressure or discomfort. Sharp, sticking, gnawing or burning pain is complained or occasionally, colicky, spasmodic pain occurs rarely and only in the intractable cases. Pain distress was present in 75 per cent of their patients selected from over a thousand gastroscopic studies. There is no particular meal relationship the pain being at times intermittent and at other times constant. The symptoms are variable in duration. Anorexia, indifference to food or fear of eating because of ensuing distress was present in 45 per cent of the cases, loss of weight was noted in 33 per cent, weakness or ease of fatigability was felt in 25 per cent, nervousness was complained of in 55 per

cent, nausea or vomiting was observed in 22 per cent and constipation or diarrhea in 10 per cent. Frequent nonulcerous occurrence of the peptic ulcer syndrome in cases of chronic gastritis has been described recently. The atrophic variety of gastritis in the nonneoplastic patients is particularly interesting because of the predominating role of "nervousness" in the patients' complaint. No pathognomonic or constant acid value to the Ewald fractional method has been observed in gastritis. Atrophic gastritis was more frequently associated with achlorhydria or hypochlorhydria, hypertrophic gastritis was more frequently found with hyperchlorhydria or normal acidity, the superficial, catarrhal, congestive, erosive and ulcerative forms vary widely. There was an increase in mucus in 32 per cent of the cases. Positive occult blood reaction occurred in 81 per cent. The x-ray method was of diagnostic value in only about 10 per cent of cases, and these were usually of the hypertrophic variety. The only reliable means of diagnosing chronic gastritis is by the semiflexible gastroscope. The authors employed a new method. It consisted in obtaining a biopsy specimen of the gastric mucosa through the open tube gastroscope from patients in whom the diagnosis of gastritis had been previously made by the closed semiflexible (Wolt-Schindler) gastroscope. When gastritis had been visualized through the gastroscope, the authors often received an unbiased report from the pathologist of definite evidence of gastritis. The authors describe methods of treatment of chronic gastritis, including elimination of etiologic factors, diet, medication, physical therapy and surgery.

**Sulfanilamide in Peritoneal Cavity**—Tashiro and his co-workers implanted sulfanilamide into the abdomen in 30 cases of peritonitis and appendical abscess. In experiments on rabbits the average maximal concentration in the blood was 22 mg per hundred cubic centimeters in animals which had received 1 Gm intraperitoneally. There was a rapid fall in the intraperitoneal concentration as the blood concentration increased, at about six hours the concentration in the blood about equaled that in the peritoneal cavity, after which the blood concentration exceeded the peritoneal concentration. The maximal blood concentration was reached almost uniformly in three hours in patients as compared to four hours in rabbits. In older individuals the gradient was not as steep, perhaps because of natural cardiovascular and renal changes. No significant gross or microscopic pathologic changes were seen in the intestine or peritoneum of rabbits following direct contact of these tissues

with sulfanilamide crystals by intraperitoneal implantation. Pus and infective material were aspirated from the abdomen of patients with peritonitis, all possible gangrenous tissue was removed and the regional abdomen was cleansed by repeated perfusion with warm isotonic solution of sodium chloride and suction. Crystalline sulfanilamide, 4 to 10 Gm, depending on the age of the patient, was implanted directly in the area of greatest infection, 2 to 3 Gm was used to coat wound layers and surfaces before the incision was closed. Pus by itself was no indication for drainage. Drains were used when irremovable gangrenous tissue or tissue of doubtful viability could not be removed. Supplemental sulfanilamide therapy was continued orally after the first postoperative day, or parenterally when a patient was unable to take it orally. There were no untoward reactions or intra-abdominal complications, wounds healed by primary intention and the patients were discharged promptly after a smooth postoperative course. The intraperitoneal use of sulfanilamide appears to be a safe, rational and effective procedure.

**Topical Application of Sulfanilamide Crystals**—Experimental evidence and clinical proof that local use of sulfanilamide powder has no adverse effect on the fate of transplanted bone is presented by Horwitz, who used the drug on 18 adult rabbits and 5 patients in whom massive bone grafts were employed. Three patients had a distinct infection at the time of operation, 1 was potentially infected and 1 was clean without a history of preceding infection and had had a bone graft for a tuberculous spondylitis. In all the operative procedure was completed with primary closure of the wound after local implantation of 4 to 16 Gm of powdered sulfanilamide. The level of sulfanilamide in the blood was maintained by the oral route for one week postoperatively. The infection of the 3 infected patients was completely controlled, and all wounds of the 1 with potential infection healed by primary intention. Of the 4 patients for whom bone grafts were employed for arthrodesing purposes the transplanted bone became well incorporated and fusion was solid by the fourth postoperative month. The fifth patient, with tibial nonunion, has thus far had most satisfactory incorporation (solid union) of the graft. The clinical results corroborate the experimental evidence and indicate that the local use of powdered sulfonamide compounds exerts no untoward or deleterious effect on the fate of a bone graft.

**Cotton as Suture Material**—The circumstances under which major surgical procedures were performed during the maneuvers of the United States Army in North and South Carolina in the fall of 1941 in a tent hospital, Sparkman and Williams point out, were comparable to those which might be encountered in the field at wartime. The problems of dust and insect control were considerable. As the circumstances predisposed to wound contamination, the added protection of a nonabsorbable suture material seemed desirable, in view of limited nursing facilities and the possible necessity of evacuating patients over long distances to station hospitals early in convalescence. Cotton was chosen. During the encampment, from October 26 to December 5, one hundred and twenty-four appendectomies were performed. Ordinary nonmercerized cotton was employed as the only suture material with the exception that fine plain catgut was used for ligating the appendical stump when it was inverted. The McBurney incision was used exclusively. There were no deaths. The cotton was sterilized by boiling for twenty minutes or by autoclaving for fifteen minutes at 15 pounds pressure. Size 80, usually black, was used for closing the skin, size 100 white for ligating blood vessels immediately beneath the skin and size 50 or 80 for closing the remaining layers of the McBurney incision. The peritoneum was closed with a continuous suture, otherwise interrupted sutures were used. The appendical stump was not inverted in 20 instances, inversion in the 104 was accomplished with size 50 or 80 cotton. When perforation, gangrene of the appendix or extensive suppuration was present, 8 Gm of sulfathiazole or sulfanilamide powder was implanted in the peritoneal cavity. The drugs were never placed in the wound itself. The wound was always copiously irrigated with isotonic solution of sodium chloride after each layer was closed. Of the 124 specimens removed, 79 showed micropathologic evidence of acute suppuration and 27 of the 79 showed gross evidence of gangrene at

operation There were 2 instances of perforation, and gross contamination occurred in 2 because of disruption in continuity of the wall of a gangrenous appendix during removal In each of these 4 cases a narrow sutured rubber dam was placed down to the peritonium, which was closed The drains were removed on the fourth or fifth postoperative day, after which each wound healed by first intention The peritoneal cavity and the wound of the other 120 patients was closed without drainage, and they were evacuated to station hospitals after a postoperative observation of eight days A small collection of uninfected serous fluid was evacuated from the wound on one occasion from 3 of the 120 patients, and 1 had a left femoral thrombophlebitis on the sixth postoperative day and the wound disrupted on the thirteenth postoperative day One other patient suddenly had generalized peritonitis on the fifth postoperative day and the abdomen was reopened An abscess had formed about the noninverted appendical stump and the abscess had ruptured into the peritoneal cavity The peritoneum, however, was sealed and the wound at this time was healing by primary intention Convalescence and wound healing were uneventful after the abscess was drained No attempt was made to remove the cotton sutures introduced at the first operation Patients were allowed out of bed on the second or third postoperative day with no ill effects Such early locomotion would not have been possible unless a nonabsorbable suture had been used as added security The results support the contentions of Meade and Ochsner that cotton may be employed safely in clean, contaminated or infected wounds

**Skeletal Manifestations of Thyroid Disease**—Bodenheimer and Barcham review the literature and present 6 cases to illustrate osseous changes in thyroid disease Not infrequently a bone lesion is diagnosed without appreciation of relationship to thyroid disease Pulsating tumors may be diagnosed as aneurysm, hemangioma, meningocele or some other highly vascular tumor The lesions are sometimes found on microscopic study to be secondary metastatic thyroid deposits occurring many years after the primary lesion was discovered or even without its discovery The question of thyroid deposits in bone ever having been a metastasis or an aberrance is still open Bony lesions of thyroid origin also have simulated hyperparathyroid lesions, endothelioma or multiple myeloma Of all the skeletal manifestations of hypothyroidism the one most often unrecognized is epiphyseal stippling The characteristic pathologic changes of deficiency in centers of ossification with irregular bone growth and other characteristic changes at the epiphyseal plate serve to differentiate it from Legg-Calve-Perthes disease Spontaneous fractures or fractures with little exciting cause have been reported in the decalcified bones of patients with long-standing hyperthyroidism Needling of so called aneurysms of the spine will be attempted less often when it is realized that these lesions are often due to a thyroid metastasis Thyroid substitution therapy in the presence of stippled epiphyses is a great aid when definite evidence of hypothyroidism is established Osteoporosis due to hyperthyroidism is sometimes benefited by thyroidectomy

**Hemorrhagic Cysts of Lung**—Hemorrhagic cysts of the lung may be congenital, infectious mechanical or neoplastic Various methods have been devised to meet the problems that arise in the management of the patient with a hemorrhagic cyst of the lung Marsupialization may result in benefit when the cyst cannot be removed Gray and Skinner report 2 cases in which such a procedure was beneficial Three months after the operation the first patient was feeling well, roentgenograms showed considerable clearing of the exudate and diminution of the pleuritis, the right portion of the diaphragm was elevated by pleuritic adhesions and the cystic cavities were somewhat decreased in size The second patient withstood the operative procedure well, he was permitted to sit in a chair on the eleventh postoperative day, he was afebrile and his general condition was excellent Large quantities of clotted black blood drained from the marsupialized region It is hoped that by marsupialization of the walls of the two cysts the uninvolved portion of the lung can be made to reexpand and obliterate the cystic cavities

**Fungus Disease of Lung**—Pulmonary conditions which simulate pulmonary tuberculosis, according to Koerth and his co-workers, are fungus disease, abscess, primary carcinoma, bronchiectasis and silicosis Symptoms, treatment and the physical and roentgen signs of 4 cases of monilia, aspergillus and actinomycotic infection are discussed The clinical symptoms of pulmonary moniliasis range from a simple dry cough up to and including all symptoms found in advanced pulmonary tuberculosis The physical and roentgen signs are as variable as the clinical symptoms and depend on the stage of the disease No clinical symptom or physical or roentgen sign is diagnostic of the disease Potassium iodide given three times a day in increasing doses to the point of tolerance is the time honored drug Actinomycoses may easily cause confusion when found in the sputum because of their close similarity to tubercle bacilli The fragments of the mycelium usually are more variable in length and size than the tubercle bacillus Furthermore, some of the segments will be seen to branch if the sputum is examined carefully This organism is less resistant to decolorization with acid than the tubercle bacillus Four types of pulmonary actinomycosis are recognized the bronchitic, the pneumonic the pleuropneumonic and the metastatic, this classification calls attention to successive stages of the same process Treatment is discouraging and consequently a multitude of remedies has been proposed Surgery does not produce striking results in the pulmonary type Aspergillosis is distinctly related to occupations in which there is prolonged exposure to grain dusts Two types of pulmonary aspergillosis are encountered the superficial type includes aspergillary catarrh and bronchitis, and the deep form causes necrosis and caseation of the pulmonary tissue The onset of aspergillosis is insidious with symptoms of cough, asthmatic attacks and anorexia As the disease progresses the cough increases in severity and the sputum becomes tenacious and may be dotted with black specks which are conidia Weight loss, an evening elevation of temperature hemoptysis and night sweats may occur In the asthmatic form progressive dyspnea disables the patient The course of the disease is chronic and pulmonary tissue is slowly destroyed until secondary infection supervenes Potassium iodide orally, inhalation of ethyl iodide, neocarsphenamine intravenously, bismuth compounds intramuscularly and roentgen radiation constitute some of the therapeutic measures

**Pregnancy Complicated by Hookworm Disease**—When ever a severe anemia, in the absence of any tangible cause, is encountered in pregnancy an intestinal parasitic infection, especially hookworm, should be considered, as pointed out by Johnston and Adam It is seen most frequently in charity clinics, especially among patients coming in contact with the soil The usual port of entry is through the skin Wickramasuriya states that hookworm disease is second to none as a cause of death or chronic invalidism in Ceylon Most of the cases in this country are seen in the Southern states Of the 6 cases of hookworm disease encountered by the authors, 3 were from a private practice of 6,350 cases and 3 were from the charity clinic at Hermann Hospital If routine stool examinations as is the present practice had been done possibly more cases would have been found The chief characteristic of the disease is anemia, the hemoglobin being as low as 15 per cent in some patients The second important characteristic is toxemia of pregnancy the severity of which depends on the severity of the infection and on the degree of anemia The finding of hookworm ova in the stool makes the diagnosis

absolute. The blood urea is usually abnormally high (average 32 per cent in 37 patients observed by Wickramasuriya) and the urea concentration is usually below 2 per cent. Treatment consists in combating anuria and eradicating the offending organism. Carbon tetrachloride is not to be used when pregnancy coexists.

**Neurosurgical Management of Epilepsy**—Meredith points out six major causes of surgical epilepsy: (a) congenital, (b) neoplastic, (c) inflammatory, (d) post-traumatic, (e) vascular and (f) degenerative brain lesions. Examples of each type are presented. The value of electroencephalography in the diagnosis of surgical lesions of the brain causing convulsions is discussed. The electroencephalogram will practically always localize a cortical lesion, whether it is above or below the tentorium, but it will not show whether it is of surgical significance or not, i. e., it is just as apt to show abnormal waves overlying cerebral softening and gliosis due to a cerebral thrombosis as it will with tumor. It repeatedly has localized cerebellar and cerebellar tumors in doubtful cases (as to clinical localization) with disappearance of the electroencephalographic focus after operation. The electroencephalogram frequently fails to localize subcortical tumors or other mass lesions below the cortex wherever they may be in the brain. An electroencephalographic focus demonstrated in a patient with generalized convulsions (in whom a pneumoencephalogram fails to show a significant lesion) will usually prove to be of little importance if operation is carried out over the suspected site (as demonstrated by the electroencephalogram) and only indifferent postoperative results are to be expected in such cases, particularly with respect to the subsequent elimination of the convulsions, unless quite radical procedures, such as an ablation of the motor cortex, are performed. As emphasized by Holland, the electroencephalogram is only one of the many diagnostic aids in the investigation of epileptic patients and is not to be considered a substitute for the all important air injections which are almost invariably carried out before operation on patients with convulsive disorders.

**Treatment of Lung Abscess**—Bradford shows that abscess of the lung is a serious disease which under generally accepted medical treatment has resulted in extensive pulmonary damage and a high mortality rate. Early surgical drainage has brought about a striking reduction in this mortality rate. Most cases of lung abscess follow operations on the upper respiratory tract or occur subsequent to pneumonias which do not resolve promptly. In the so-called idiopathic cases the incidence of oral infection is extremely high. Careful treatment of these varied entities is important in the prophylaxis of lung abscess. The bacteriology of lung abscess is complex. Isolation of the original infecting organism is virtually impossible. Anaerobic organisms, as secondary invaders, are responsible for maintaining and extending the disease. Synergism is probably an important factor. A knowledge of the pathology of lung abscess is essential to an understanding of previous failures in treatment and in carrying out a logical and successful treatment. Every case of lung abscess deserves a trial of medical treatment, provided adequate oxygenation and drainage can be established at once and maintained continuously. Failure to accomplish this is the indication for immediate surgical drainage. The external drainage of lung abscess cavities is a simple, logical and successful surgical procedure.

**Simple Method for Differential Culture**—Fleming points out that by spreading a small quantity of methylrosaniline over half of the culture plate of blood agar after it has been planted it is possible to isolate a few streptococci from among the multitude of staphylococci, just as it is when methylrosaniline is incorporated in the medium. When this technique is used it is necessary to start spreading the chemical used where the inoculum is lightest and to proceed toward the heavier inoculum, otherwise there may be so many resistant bacteria that a confluent sheet of growth ensues. The three chemicals that can be used in this way are penicillin, potassium tellurite and methylrosaniline. The advantages of such spreading of one of these chemicals are that special mediums need not be prepared and that one half of the culture plate is an ordinary culture and the other half a selective culture.

**Asthma Treated with Patient's Blood Serum**—Using a sterile syringe and test tube or a vacuum venule, Lapp withdraws about 30 cc. of blood from a patient suffering from asthma. The blood is allowed to clot at room temperature for two hours. It is then stored in a refrigerator. Serum is drawn off the top as required and injected subcutaneously. A much firmer clot is formed as treatment progresses and proportionately more serum is expressed. No local or general reaction was noticed. Many patients who were treated for hay fever by this method remained free from colds for long periods, although they had previously been most susceptible.

**Psychiatric Syndromes Following Blast**—Anderson discusses psychiatric symptoms in 8 cases that followed close exposure to the detonation of a high explosive bomb. In each there were certain common features which from the psychiatric

angle indicated a relationship to structural cerebral changes. The relationship may be easily overlooked because in many cases a definite history of head injury and a long period of unconsciousness are absent. Evidence of an organic reaction was shown by (1) residual intellectual impairment, (2) memory changes, (3) slight and transient aphasia in 2 and (4) occasional changes in the cerebrospinal fluid. A degree of intellectual impairment, characterized by complaints of forgetfulness and lack of concentration was present. Memory changes were by far the most striking part of the syndrome, in some the memory was imperfect for events immediately following the explosion, and in others there were periods of global amnesia. Such amnesia may have a definite medicolegal significance. None of the patients were observed immediately after the incident, but the patients reported that after the explosion they felt "dazed" or had a numb sort of sensation. There is evidence that consciousness was clouded in 1 or 2 patients it persisted for days or even months. Besides associated, probably constitutional, depressive features affective lability and apathy were observed. The apathy was the more impressive. Some of the other symptoms were psychomotor changes, dementia, motor aphasia, dysphasia and depression. Little can be stated definitely as to prognosis. It may depend to a large extent on the promptness of treatment, which is based on the analogy of cerebral trauma that is, at least a fortnight's complete rest in bed with appropriate sedation and the general measures for treating head injury. Coexistent or subsequent constitutional or psychogenic changes demand competent treatment on the usual psychiatric lines.

**Epilepsy Following Application of Sulfathiazole Near Brain.**—Watt and Alexander warn against the use of sulfathiazole close to the brain, particularly in the frontal region. When sulfathiazole became available they applied it in the same manner as they had sulapyridine. 2 to 3 Gm of the powdered drug, sterilized in the autoclave, was insufflated into the wound after the dura mater was closed both deep and superficial to the bone flap. The closure of the dura mater was, as usual, never complete enough to prevent cerebrospinal fluid from percolating through and thus gaining direct contact with the sulfathiazole. All went well with their first 2 cases, and then postoperative complications, in the form of epileptic seizures in quick succession, beginning about two hours after operation, became intermittent. There were two deaths among the 5 patients exhibiting this symptom, that is five of the six frontal explorations in which sulfathiazole was used were complicated by postoperative epilepsy. In the frontal operation, not complicated by epilepsy, the thickened dura was not opened, this is significant. Four patients having lateral or posterior craniotomy in whose wounds sulfathiazole was also used did not have epilepsy, even 1 patient with a history of epilepsy. This epileptogenic property of sulfathiazole has been confirmed experimentally in cats, it is apparently not shared by sulfanilamide, sulapyridine, sulfadiazine or sulfacetamide.

**Use of Pholedrine at Major Operations.**—Dodd discusses the restorative action of pholedrine, a pressor agent on the blood pressure during and after major operations. Blood pressure records during operations have been made on 300 patients since 1932 and pholedrine was used in 89 of these. The effective dose of pholedrine was 0.2 to 0.25 cc intravenously, 1 cc intramuscularly and 0.2 to 0.25 cc intravenously plus 0.75 to 0.8 cc intramuscularly. Pholedrine given in these amounts as a single dose raised a low blood pressure to within 25 per cent of the normal in 89 per cent of patients. Pholedrine given in repeated doses (up to five) still raised the pressure to normal or over in 82 per cent of the patients. A useful rise was noted in almost all subjects when the correct dose was used. If the operation is long or shock is appreciable the intramuscular dose may be increased to 1.5 cc. No fall in pressure was observed after one hundred and twenty-six injections of the agent. Excessive rises can be avoided by correctly assessing the patient's condition and accurately estimating the dose. The patient's own recuperative power must be reckoned with and given time to act. Variability of the pulse after pholedrine was observed three times after the one hundred and twenty-six administrations but otherwise no ill effects were encountered. Leptazol was ineffective by itself but when combined with pholedrine it had a powerful pressor effect.

**Aneurine and Carbohydrate Metabolism in Diabetes.**—Kodicek investigated under well controlled conditions the effect of aneurine (vitamin B<sub>1</sub>) on the blood sugar of 32 middle aged patients with mild diabetes with and without the addition of insulin and analyzed statistically the blood sugar curves. They were all on a standard Joslin diet, most or them without previous insulin treatment. The effect of aneurine was examined on the fasting level of the blood sugar of 20 patients, and in 12 the combined action of aneurine and insulin was investigated. The results reveal that aneurine either alone or in combination with insulin does not exert any influence on the blood sugar of the diabetic patient, at least in thirty-sixty or one hundred and twenty minutes after its injection. That more prolonged administration of aneurine is also ineffective was suggested by the fact that 10 mg given daily for four weeks to 2 patients did not improve their sugar tolerance or insulin

requirement. The results do not support the view that there is any direct interconnection between the disease and anurine requirements, and they do not justify its use for the purpose of increasing the sugar tolerance of the diabetic patient. Diabetic diets may be often low in vitamin B<sub>1</sub> so that a partial deficiency requiring treatment with anurine is likely to be an incidental accompaniment of diabetes.

**Painful Shoulder**—Kelly was able to relieve patients suffering from painful disability of the shoulder by percarne infiltration. A remarkably constant clinical picture is presented in the developed case. The main features are (1) pain in the shoulder on abduction of the humerus, (2) severe aching at night, (3) tenderness on the "point" of the shoulder. The pain on movement may vary in intensity, it may limit all movement or may be just a twinge when the humerus is near the horizontal while raised or lowered. It is usually felt near the insertion of the deltoid rather than in the joint itself. The aching at night is usually the chief complaint, the pain on movement is more easily borne. Examination usually reveals a point of tenderness on the greater tuberosity, which disappears under the acromion on abduction ("Dawbarn's sign"). This sign may be absent, or tenderness may be more widespread over the deltoid region. Crepitus may be felt in the shoulder on abduction. In severe cases of shoulder disability ("frozen shoulder") fixation of the joint, at first by muscular spasm and later by adhesions, may be present and trophic changes may become manifest in muscular wasting and decalcification of bone. Less than half of the patients give a history of an injury to the shoulder, this usually takes the form of a fall on the outstretched arm or the point of the shoulder ("stubbed shoulder"). The author detected a circumscribed area of tenderness in the trapezius and infiltrated it deeply and widely with procaine hydrochloride. Sometimes as much as 20 cc of a 1:1,500 solution of "percarne" or a 1:200 solution of "novocain" is necessary. The injection often is painful, and the patient will frequently faint if he is not made to lie down beforehand. Ten cases were encountered in which infiltration proved unsuccessful after a prolonged trial. If no alteration in the symptoms occurs after two thorough infiltrations, further perseverance will prove ineffective. In two of the unsuccessful cases the shoulder disability was part of chronic generalized arthritic changes. In 16 cases a complete cure resulted from injections into the trapezius or, as seems more probable, the supraspinatus or levator anguli scapulae, which are situated directly beneath the trapezius. In many cases a single injection was successful, in those in which further injections were required a good prognostic sign was a decrease in the symptoms after the first injection, or a change in the character and distribution of the pain. Cases of shoulder disability can be differentiated from those presenting the picture of brachial neuritis. The foregoing observations are in line with recent researches on fibrositis, and emphasis is laid on the important part played by the trophic nervous reflex in its symptomatology.

**Meningococcal Meningitis**—Deruaz and Novel point out that the bacteriologic demonstration of the meningococcus and of its type is unimportant unless it aids in the confirmation of the clinical diagnosis and in the indication for serum treatment. Since the beginning of the era of serotherapy it has been true that recognition of meningococci of type A, B, C or D is helpful. This differentiation has not been nullified with the introduction of sulfonamide derivatives. Recently Armand and others have reported that sulfanilamide therapy proved to be highly effective in the presence of the type B meningococcus but that serotherapy was most successful in the presence of meningococcus A. The authors selected for study 7 cases of meningococcal meningitis in which culture permitted isolation of a stable type of meningococcus that would lend itself to laboratory investigations. The determination of the type of meningococcus cannot be made from the study of fermentation of sugars alone, it must be confirmed by serologic studies. Biochemical research revealed the variable individual characteristics of meningococci such as aberrant fermentations. In the authors' cases fermentation did not agree with type. Of seven strains of meningococci isolated, only two could be acclimated to simple gelose. Macroscopic agglutination readily permits the determination of the meningococcal types. In 1 of the cases the type B meningococcus was detected, while in the remaining 6 type A was present. No relationship existed between the bacterial type and the gravity of the disease. The mortality was related more to the late initiation of the treatment rather than to the type of meningococcus. Incubation, course and curability of the disease did not seem to be influenced by the type of the meningococcus present. Before the sulfonamide era meningococcal infections of type B were considered most grave. Armand-Delille points out the efficacy of sulfonamide derivatives in this type, particularly in nurslings. The authors' observations likewise emphasize the remarkable effects of these drugs in meningococcus A infections. Improvement in the cerebrospinal fluid after chemotherapy was very rapid. The clinical course depends more on the early initiation and the intensity of chemotherapy rather than on the type of meningococcus.

Classification of Pulmonary Tuberculosis. Draft for Practical New Nomenclature for Tuberculosis. S. Puder—p. 102

**Bronchitis Plastica**—According to Seiler, bronchitis plastica is sometimes referred to as bronchitis fibrinosa, bronchitis pseudomembranosa, bronchitis crouposa and mucinosa. The chief characteristic of the condition is expectoration of coagulums formed within the bronchial lumen by exudates. The disorder is rare. The author reports that a woman aged 41 suffered at irregular intervals of from three to ten days bouts of fever which persist one to three days, accompanied by cough, dyspnea and expectoration of coagulums. After these had been expelled, the fever subsided. The recurrent bouts were accompanied by impairment of general health, tachycardia,

oppression, dyspnea and anxiety. Examination of the lungs revealed changes during the attacks and roentgenoscopy showed shadows in the right lower lobe that gave the impression of tumefactive foci. Tar preparations, potassium iodide, arsenic compounds and various expectorants were ineffective. Induction of pneumothorax was followed by two mild attacks of fever, after which the cough subsided and there was no further expectoration of coagulum. The pneumothorax was maintained and there were no attacks. The patient's general condition has greatly improved. Symptoms of the existing exophthalmic goiter were likewise favorably influenced. Artificial pneumothorax is to be recommended for cases of this type particularly when the disease process is localized, as may be evident from repeated roentgenoscopic examinations during attacks and intervals.

**Heat Denaturation of Proteins in Blood Serum**—Wuhrmann and Wunderly point out that Weltmann's dilution series of calcium chloride solutions aims to determine the threshold value of flocculation as indicated by the dilution intensity of the serum proteins. In order to facilitate the characterization of the pathologic globular proteins the authors added a new test tube to the Weltmann series. This tube contains only double distilled water. If blood serum in a 1:50 solution is cooked in this for fifteen minutes the serum proteins become denatured by heat. Whereas the solution intensity of normal serum prevents turbidity, an increase in isolable globulins (euglobulin and pseudoglobulin I) cause cloudiness during dilution. After heating, the turbidity produced in this manner is sufficiently isodisperse to permit nephelometric evaluation. The technique of producing a nephelogram has been described previously by the authors. They demonstrate graphically the close relationship with Weltmann's coagulation band. Their new method detects changes in the blood proteins by determining the turbidity by means of the step photometer. The authors demonstrate the direct relations that exist between their method and the Takata-Ara reaction in Jezler's modification and discuss the protein chemistry that forms the basis of the two methods (increase in certain coarsely dispersed plasma proteins). The detected turbidity values are the higher the more strongly positive is the outcome of the simultaneously executed Takata-Ara reaction. If the absolute turbidity units exceed 0.0120 or 0.0125, a positive Jezler reaction can be counted on. Turbidity values between 0.0020 and 0.0120 indicate changes in the blood serum, which in consideration of the existing clinical condition cannot yet or can no longer be detected with the simultaneously executed Takata reaction. Their great clinical importance cannot be denied. The turbidity values are independent of the total protein, the bilirubin and the rest nitrogen values as well as of the outcome of the sedimentation test. The advantages of the new method are that the result can be read objectively in the step photometer, that it is completed in thirty minutes and that the quantity of serum required is only 0.1 cc.

**Immunity Reactions and Sulfonamide Dosage in Pneumonia**—Maier and Grumbach point out that the discovery of the sulfonamides has not diminished the importance of immunobiologic processes but has given it a new direction. Certain investigators have denied that sulfonamide therapy influences the time of appearance of antibodies while others have noted considerable differences in their appearance after sulfapyridine and after sulfathiazole. It appeared that only one fourth of the patients treated with sulfapyridine had a positive precipitin reaction whereas three fourths of those treated with sulfathiazole gave positive reactions. This appears contradictory in view of the fact that fever disappears more rapidly under the influence of sulfapyridine than under that of sulfathiazole. American investigators made daily tests of the agglu-

tion values in 200 cases of pneumonia with the aim of determining the time when chemotherapy could be discontinued without the hazard of a relapse. There were many cases in which no agglutinin became demonstrable in spite of a favorable effect. They regarded this as "abnormal." Maier and Grumbach point out that the explanation is not necessarily to be found in the immunobiologic sphere. Munzinger has observed at the Hygiene Institute in Zurich that only for 99 of 209 typical pneumococci could corresponding agglutinins be found in the serum. In these tests not the missing agglutinin formation was stressed but rather the possibility that in an undetermined but considerable percentage "false," that is, epiphytic, pneumococci were found which had no connection with the disease. The authors stress this possibility and think that the time of appearance of the agglutinins and the prognostic evaluation based on it must be accepted with reservation. They determined the agglutinin content of patients with pneumonia against the homologous type of pneumococcus as well as against types 1, 2 and 3 pneumococci. Their results corroborated their former opinion that this is only one phase of the immunity. The clinical course and in particular, the complications are unrelated to the appearance of the agglutinins. Determination of their appearance is therefore of no value for the prognosis or the chemotherapeutic management. For the present, estimation of immunity in pneumonia must be based chiefly on the temperature curve, the leukocyte studies and the general condition of the patient. Because of the tendency to relapses during the first seven days of pneumonia, chemotherapy should be continued for an adequate length of time.

**Thrombocytopenia Due to Sedormid**—Moeschlin points out that the acute thrombocytopenia occasionally caused by sedormid (allyl-isopropyl-acetyl-carbamide) is a typical disturbance of the platelet apparatus, the study of which may throw light on the essential nature of anaphylactic thrombocytopenias as well as on the entire mechanism of the platelet regulation. Some authors consider an isolated impairment of the megakaryocytic apparatus of the bone marrow responsible for this type of thrombocytopenia, whereas others regard increased destruction (thrombocytolysis) responsible. The author attempted to clarify this problem by studies of sternal punctates and by controlling the decrease and subsequent increase in platelets during experimental tolerance tests with the aforementioned hypnotic. He describes observations in 10 cases. Observations of the megakaryocytes in sternal punctates during acute thrombocytopenia and during its later course disclosed no definitely pathologic changes. A slight deviation to the left developed in the megakaryocytic series of the bone marrow immediately after the development of acute thrombocytopenia. The myelogram remained practically unchanged, except for a mild increase in erythroblasts as a sequel of hemorrhages. Two or three days after the acute thrombocytopenia a noticeable and a progressive increase in blood platelets became apparent, and after from five to seven days normal values were reestablished. At first pathologic and large forms were often seen. They were interpreted as the result of inhibited maturation of the megakaryocytes. The exact control of the decrease in thrombocytes during the tolerance test reveals a rapid disappearance of thrombocytes in particularly sensitive persons as early as from thirty to sixty minutes. This indicates that in addition to the impairment of platelet production in the bone marrow the thrombocytes likewise disappear from the blood. Two blood transfusions in which a person sensitive to sedormid served as donor were carried out at the height of a thrombocytopenia; they produced in the recipient no decrease in the thrombocyte values. This seems to indicate that the blood contains no platelet lysin during acute sedormid thrombocytopenia. It proved impossible to transfer the hypersensitivity passively by transfusion to the recipient. The author concludes that in hypersensitive patients sedormid produces an impairment of the thrombocytes in the circulating blood and that in addition the maturation of the megakaryocytes in the bone marrow is temporarily inhibited. The hypersensitivity toward such substances is probably not of peripheral but of central origin, resulting from a sensitization of certain nervous centers that regulate the entire platelet apparatus.

0.5 to 2 per cent in an isotonic solution of sodium chloride to be used as nose drops or spray. Such an official preparation or a similar approved decongestant, either in isotonic sodium chloride or isotonic dextrose drops or spray is safe and should be tried. Such solutions stimulate the cilia and produce no harm in the function of the intranasal mucous membrane.

Only solutions have a tendency to reduce the speed of ciliary action and hence are not so strongly emphasized at the present time in the light of the newer physiology of the nose and its membrane, as well as the recent reports of lipid pneumonia.

These solutions are not absorbed as rapidly as watery salts, so that systemic effects are less likely to be encountered.

Because this patient has signs of effort and coronary artery disease it might be best to use a 0.5 to 1 per cent ephedrine alkaloid in light liquid petrolatum, to be used as a fine spray to decongest the engorged nasal mucous membrane during the dry congestive stage of the head cold.

Care must be taken that this solution is fresh, therefore, be sure that the pharmacist has fresh preparations and prescribe only a small quantity at intervals.

If the only preparation does not produce good results, try sprays of 0.5 to 2 per cent ephedrine sulfate in isotonic solution of sodium chloride.

It is important to emphasize once again that the nose should be kept open and the mucus free and clean.

### HYSTERICAL OCULAR SYMPTOM

*To the Editor*—A white man aged 44, a grocery clerk, presents a negative family history except for bronchial asthma. He had the usual childhood diseases, has had influenza every winter, has sore throat often and has had diminished hearing for the past two years. His present complaints began four years ago. About once a week he gets a spell of rolling his eyeballs upward and to the right, and his head turns to the same side with the face turned upward. This condition lasts from a few minutes to a half hour and cannot be produced voluntarily. The spells come on more readily if he snoops a lot or if he is greatly excited. Relief is obtained by lying down and shutting his eyes, whereupon a clonic blepharospasm appears. When the eyelids are opened the eyes look straight but gradually roll upward to the former position. He complains of blurring vision during the spells and cannot see below the level of his head. He feels the oncoming spell by a heavy pressure in the eyeballs a half hour before. His mind is not dimmed during the spells. The eye specialist could not find anything wrong, and several practitioners treated him for his nervous disease without success. He uses neither alcohol nor nicotine. His eyes show a normal appearance and pupils react to light and accommodation fairly well. During the spell, convergent strabismus is noted. There is no adenopathy nor tenderness over nerve points. The heart is within normal borders, and no murmurs are heard. Reflexes are increased. Kahn test is negative. I would appreciate your advice on this case.

M D, Mount Zion, Ill

*ANSWER*—This sounds like a purely hysterical manifestation and corresponds closely to the description given by Ullrich and by Wildbrand-Saenger. A rather extensive discussion of similar phenomena can be found in the sixth volume of the *Kurzcs Handbuch der Ophthalmologie*, published by Schneck & Bruckner. An examination by a psychiatrist or a psychoanalyst would seem to be indicated.

### CARE OF FINE HAIR

*To the Editor*—A woman patient whose hair is soft and silky has much difficulty with coiffures. Is there any evidence that vitamin therapy has any effect on the hair or is there, to your knowledge, some safe external preparation which may be used?

M D, Ohio

*ANSWER*—There is no evidence that vitamins have any effect on the texture of the hair.

The hair should be shampooed at weekly intervals with one of the so-called soapless shampoos, of which sulfated olive oil may be regarded as the best. In addition to their excellent detergent qualities, these shampoos also have a good lubricating value. The latter may be enhanced by adding liquid petrolatum in various proportions, depending on how dry the hair is. The addition of liquid petrolatum does not materially decrease the cleansing action.

If ordinary shampoos are used, the hardness of the water should be ascertained and a suitable water softener added before washing the hair. Information on this point may usually be obtained from the local health department. In hard water, soap will form insoluble salts, which cannot be washed out of the hair. As a result the hair becomes dull and brittle and cannot be set properly. Acid rinses after the shampoo are often recommended but useless.

Care should be taken regarding permanent waving, especially with fine silky hair. A preliminary "test curl" will permit the proper regulation of the heat. Too frequent permanent waving will render the hair excessively dry and difficult to dress.

Massaging the scalp with olive oil a few times weekly may also be of advantage.

### TETANY OR HYSTERIA?

*To the Editor*—A woman aged 23 was delivered by cesarean section of a premature infant three months ago. She made an uneventful recovery, and the baby remained in the hospital. Her breast milk was brought to the hospital to feed the baby, and it was found that she was producing so much milk that there was plenty to feed another infant. On February 21 the baby was brought home, and on that day suddenly the mother experienced a severe pain in the back of the neck and back, causing opisthotonos, abdominal cramps, generalized aching and headache. A diagnosis of calcium deficiency was made, and calcium chloride was given in the vein with almost immediate results. The breasts dried up and the baby was put on the bottle. However, her spasms continued and soon the patient would become completely unconscious with her jaw absolutely rigid—this without warning and at indefinite times during the day, limited to once daily. Response to calcium was immediate. She has had these attacks about every other day to every day since February 21, has had calcium in the vein and intramuscularly, solution of parathyroid, viosterol and vitamin D and calcium by mouth but the attacks continue. Between times she is perfectly well, although her appetite is poor and her normal red blood count has fallen. Please advise as to prognosis, treatment and value of blood transfusions.

M D, Oklahoma

*ANSWER*—Unfortunately nothing is said in this patient's record concerning the level of blood calcium and phosphorus. While tetany is suggested as the diagnosis by the history of pregnancy, the galactorrhea, the symptoms as outlined and the response to calcium therapy, the diagnosis of calcium deficiency has not been established with certainty. Until the diagnosis is based on a definite demonstration of the lack of calcium, the possibility of other forms of tetany and of hysteria should be considered.

In the event that the case is one of tetany and the calcium content of the blood is depleted, continuation of treatment along the lines now employed eventually should lead to cure. It is necessary, of course, to maintain the blood calcium at or above the normal level. In many cases of tetany the oral administration of dihydroxytachysterol proves helpful. This is particularly valuable in chronic cases when treatment must be continued over a long period of time.

In the event the blood chemistry is found normal and continues so on rechecking, the management of the case should include some form of psychotherapy along with liberal use of sedatives.

Blood transfusion does not seem to be indicated and would probably prove futile.

### MUMPS AND PURPURA

*To the Editor*—Please advise as to the occurrence of purpura as a sequela three weeks after the onset of an attack of mumps. Holt and McIntosh, as well as Brenneman's *Pediatric System*, fail to make any mention of it. The second edition of Griffith and Mitchell mentions it as a rare complication, but I find no reference in the past three years in the *Quarterly Cumulative Index Medicus*.

Henry Mitchell Gloubman, M D, Hartford, Conn

*ANSWER*—The occurrence of purpura three weeks after the onset of an attack of mumps may be an isolated phenomenon which has nothing to do with the mumps. The reference in Griffith and Mitchell (*The Diseases of Infants and Children*, ed 3, Philadelphia and London, W B Saunders Company 1933) merely states that "among other unusual complications and sequelae may be mentioned erythema, purpura, endocarditis, pericarditis, polyarthritis, peritonitis, laryngeal stenosis, appendicitis and pneumonia." They do not mention that it may occur weeks after the onset of mumps, and petechiae may of course occur during the course itself of any severe infection. Obviously the question cannot be answered satisfactorily without knowing all the details of the case.

### PHOTOGRAPHIC INDUSTRY AND CATARACTS

*To the Editor*—Do you know of any instance on record in which cataracts have been produced by exposure to chemicals used in the processing of motion picture films? There is a case in this country at the present time in which a claim is being made that cataracts are produced in this way. I do not know the details, but the question has come to us as a photographic industry. I know of no instance in which this has been true.

W A Sawyer, M D, Rochester, N Y

*ANSWER*—As far as the literature shows, there is no such case on record. There are only three ways in which a chemical substance could be absorbed to produce cataractous changes in the lens: (1) through the respiratory passages, (2) through the alimentary tract and (3) through the skin. The first two are, of course, out of the question. The third method is possible, but, as far as known, none of the chemicals used in the photographic industry will produce changes in the crystalline lens.

## DERMATOLOGY IN THE ARMY

CHAIRMAN'S ADDRESS

C F LEHMANN, MD

Lieutenant Colonel M C U S Army  
SAN ANTONIO, TEXAS

War calls for unselfish effort and sacrifice on the part of every one. This particular war will drain our resources of money, men and material and will tax the skill and brain power of the country immeasurably. American medicine has already contributed a good share in skill and talent to the military efforts and is now cooperating well on the realization of a program of distributing itself equably to care for military, civilian and industrial needs. The military needs naturally are to be satisfied first with those best qualified for such duty. This will throw added burdens and duties on those who are left to care for the civilians. The whole program will result in a readjustment of every one's manner of living or conduct of business, and there will be no easy berth for any one—not even the slacker. The effort has to be extreme and the only ones immune from the pinching effects of it should be institutionalized psychopathic patients and babes in arms.

When called into service the first lesson for a dermatologist to realize is that he is a doctor and will be used as such. He has defined himself as an "internist who knows the skin," and he will be challenged accordingly. This is not meant to indicate that specialists are not needed and will not be used as such in the armed forces, for every specialist will be of value. However the plans of organization call for a distribution of medical officers according to where physicians are needed and what is most expedient. These requisites are to be satisfied first before a physician can be expected to be put into a limited field wherein he does nothing but the work that he did in civil life. This is no time for any of us to indulge in any misgivings, whether we are civilians or in uniform. It takes time to organize men and distribute doctors properly, and we must remember that in days of peace the reserve force was not fully equipped with men, so that when war started it was necessary to use doctors first as doctors and not as specialists. We have a war to win, and each of us has a part to play. We are expected to have a working knowledge of general medicine and to contribute this. Our specialty qualifications are a secondary consideration.

Military medicine has three chief purposes: (1) the selection of the physically fit, (2) prophylaxis and (3) the treatment of the injured and sick. While very

important, the last is the easiest and the least important in war. The selection and separation from the service of the physically unfit, the malingerers and the psychopathic persons is essential in the formation of a strong man power. These persons should be, and many are, eliminated by the local draft boards and some more are culled at the induction centers. Yet a number of undesirables get into the service. They are encumbrances and the military forces have no place for them. The Army and Navy are not rendezvous for criminals and men with dementia precox, they are not vacation adventures in which to place problem children, and they have more serious duties than to pamper mollycoddles. We are not fighting interior races but armies composed of superior specimens of physical manhood. It is to be hoped that we will have enough strong virile men.

Certainly every cooperation should be given by the medical profession in this matter of selection of the physically fit for our military forces. It is appalling to contemplate the number of inferior specimens of American manhood who have been turned down on entrance or have been separated from the service after induction into the Army. This reflects on our eugenics, our eugenics, our soft ways of living, but that is not the country's problem now. We must first be concerned with removing hell from earth before trying to build a utopia on it.

Preventive medicine has its most important field in wartime. Sanitation, control of vectors, pure food and water, eradication of disease carriers, and immunization are essential medical practices which are second nature to all physicians whether public health experts or dermatologists.

The dermatologist's training fits him for general medicine. It embraces syphilology, histopathology, pharmacology, biochemistry and radiation and physical therapy. He has delved into psychology, gynecology and gastroenterology. Very few realize what a broad field is covered in the examination given by the American Board of Dermatology and Syphilology. The dermatologist's work in allergy gives him a wide perspective on general medicine. It develops an analytic mind which is meticulous about details, searches for truth and protects the dermatologist in a great measure from worshipping therapeutic and etiologic fetishes. Such qualifications bespeak resourcefulness and versatility, which are prime requisites for a medical officer. There are 670 registrants of the American Board of Dermatology and Syphilology. From them will come a valuable addition to the armed forces.

### DERMATOLOGIC PROBLEMS

The variety of dermatoses encountered in military medicine is less than in civilian life because the preliminary examinations cull out many of the chronic conditions such as extensive nevi, neoplasms, lupus

From the Station Hospital, Fort Sam Houston.  
Read before the Section on Dermatology and Syphilology at the  
Ninety-Third Annual Session of the American Medical Association  
Atlantic City, N. J., June 10, 1942.

erythematosis and psoriasis. Atopic dermatitis will be encountered occasionally, but such a diagnosis is a cause for discharge, and therefore the treatment of it is limited. Conditions of a recurrent nature that require repeated hospitalization cannot be tolerated, because every effort of military medicine is aimed at reducing the number of noneffective soldiers. Therefore the chief dermatologic problems will be acute conditions, such as irritations, burns and infections. Medical officers will be spread thick in most places, and this will require standardization of treatment methods.

The chief dermatologic problems will be therapy, syphilis, insect bites, dermatitis venenata (rxv) and trichophytosis, excepting endemic diseases in foreign countries. The following discussion of these topics contains nothing new to dermatologists but is offered with the purpose of answering questions that are frequently propounded by nondermatologist medical officers who are called on to treat those conditions.

#### DERMATOPHYTOSIS

The two chief fungous infections that affect soldiers most commonly are dermatophytosis of the feet and tinea versicolor. They find cultural conditions most favorable. When it is realized that their spores may live in the clothing<sup>1</sup> that sterilization of floors is difficult and that shoes serve as a good culture medium,<sup>2</sup> this increased incidence is explained. The effect of close contact on the incidence of dermatophytosis of the feet is seen in a study of students at the University of California.<sup>3</sup> The incidence of 51.5 per cent at the beginning of a semester increased to 78.6 per cent at the end of the semester in a group of 1,000 freshmen who were exposed to the gymnasium environment.

The successful eradication of pityriasis versicolor entails prevention of the reimplantation of the organism on the skin from the clothing along with persistent local treatment, which in most cases would require individualized care—a desideratum difficult to obtain in a unit that is mobile.

These diseases gain incidence in hot weather, and this is explainable by the fact that heat and moisture favor the propagation of the organisms. Tinea versicolor frequently takes on an erythematous appearance, losing its common fawn colored characteristic. This is no doubt due to the irritation of perspiration and friction of clothing which changes the otherwise inert infection into a mild inflammation. It never loses the characteristic crinkled appearance of the surface epithelium which peels easily on light scraping with an instrument. The condition is commonly seen exhibiting confluent patterns that cover solidly the back or front of the torso. In these widespread cases there are no associated sensory changes—no itching—but an occasional complaint of burning on perspiration.

The effect of heat and perspiration on dermatophytosis of the feet is to raise the incidence of the inflammatory types. Lewis<sup>4</sup> in a cultural study of 215 cases found that *Trichophyton gypsum* is the organism usually responsible for the inflammatory types of the infection. However, in hot weather other factors enter into the production of disabling foot infections. The presence of the mycelium of the fungus in the rete

causes an easy detachment of the protective keratin layer. The high top shoe adds to a cause for perspiration, which in itself macerates the keratin layer. Friction against the shoe and weight bearing add enough trauma to devitalize the skin, which favors the propagation of pyogenic organisms, which thus frequently become the predominant infection.

**Treatment**—The treatment of infections of the foot is most satisfactorily accomplished by more attention to certain principles of treatment and less to any particular medicament.<sup>5</sup> These demand treatment of the skin rather than of the primary disease. These principles are roughly as follows: 1 Allaying the inflammation before resorting to the stronger fungicides, in other words, not irritating an already inflamed skin with strong chemicals. 2 Rest—the response to treatment is greatly accelerated by avoidance of weight bearing and rubbing of the infected skin. In cases in which there has been an exfoliation of the skin as a result of the disease plus keratolytic medication, the feet should be given time to regenerate a tough integument before the individual resumes heavy duty on his feet. 3 Use of keratolytic agents when the skin is ready for them. Most fungicides serve a dual purpose: first, they have either a fungicidal or a fungistatic effect and, second, they thin the infection by causing a “growing off” of it. 4 Prevention of early recurrences by sterilization of shoes and use of foot powders.

Numerous methods of treatment have been proposed. Strickler<sup>6</sup> has recommended the use of the Henal vacuum vaporizer in using iodine. Swartz<sup>7</sup> has recommended treatment by inhalations of ethyl iodide. (This is not without danger.) Iontophoresis of copper sulfate was advanced as a treatment.<sup>8</sup> This resulted in a short lived wave of popularity and received proof of its worthlessness by the experiments of Greenwood and Rockwood.<sup>9</sup> Various studies on fungistatic and fungicidal properties of drugs have been made but the most significant are as follows: “Iodine transcends all other medicaments in restraining the growth of certain molds”,<sup>10</sup> “iodine and chlorine (surgical solution of chlorinated soda) have the highest phenol coefficients”,<sup>11</sup> “potassium iodide appears to possess the property of enhancing fungicidal power of vaporized iodine to a considerable degree”,<sup>12</sup> the combination of salicylic and benzoic acids works far better than either one alone.<sup>13</sup> The use of iodine is not as popular as Whitfield's ointment or even as the combination in Strickler's solution (which is iodine crystals 1.3 Gm, potassium iodide 1.9 Gm, salicylic acid 1.9 Gm, boric

acid 38 Gm and alcohol [50 per cent] to make 591 cc.) This is partly because of the frequent irritation of the skin induced by iodine. However, a recent product iodocholeate,<sup>13</sup> gives promise of becoming a valuable addition to the armamentarium of "ring-worm therapeutics" because (1) the iodine in iodocholeate is released from its adsorption to bile salts as free iodine more slowly than the iodine in the tincture—in other words is less volatile, (2) the iodine in this product combines less with protein than the iodine of the tincture. Schrimberg and Kolmer<sup>10</sup> found brilliant green the best restrainer of growth and methylosaniline the best fungicide among the dyes. Castellani's formula<sup>14</sup> of carbolfuchsin though it does not serve as a panacea, serves a good purpose in practice, particularly when a nonirritating fungistatic agent is desired. Wise and Wolf<sup>15</sup> listed the following agents as fungistatic or fungicidal and suitable for use in practice: ammoniated mercury, peruvian balsam, benzoic acid, betanaphthol, mercury bichloride, iodine, chrysarobin, oil of cinnamon, phenol, potassium permanganate, pyrogallol, resorcinol, salicylic acid, silver nitrate, sodium thiosulfate, sulfur, tar, thymol.

In treating the disease in the Army one cannot always follow a fixed routine and has to vary treatment according to conditions as well as what medicaments are obtainable. The following routine is suggested, as it employs drugs that are standard items on the Army drug list. It can be divided roughly into (1) treatment in the acute inflammatory stage, (2) treatment in the subacute stage, (3) treatment to the intact skin with fungicidal agents.

**Treatment for Acute Inflammation.** Rest is a valuable aid, particularly if the secondary infection has resulted in cellulitis or lymphangitis. If the secondary pyoderma is attended with pustules, drainage is essential. Tops of all pustules should be manicured away and wet dressings should be used. It is important in this stage not to use eczematogenic drugs (i. e. those likely to cause a sensitization dermatitis, such as picric acid). Neither should keratolytic agents be used, such as the Whitfield formula. The condition should be treated for what it is—a cellulitis. Wet dressings continuously applied are best. The choice of the agent is optional. One of the following will be of value: (1) liquor aluminum acetate diluted 10 per cent, applied at room temperature uncovered to allow evaporation, (2) warm potassium permanganate solution (1:6,000), (3) warm boric acid solution, (4) warm magnesium sulfate solution. The dressing should be taken off daily. It is helpful to soak the affected parts in warm soapsuds for ten to fifteen minutes to soften the skin. At this time all pustules and attached skin that dams back infection should be carefully manicured away. This is to be followed by some oxidizer such as a 2 per cent solution of sodium perborate for another ten to fifteen minutes. It is an additional aid in softening the detritus and epidermal scales. The wet pack is reapplied for another twenty-four hours. In using the wet pack one must take care to see that it is applied correctly. Otherwise time will be lost. It should be applied so that the dressing is solidly against every contour of the inflamed skin, to accomplish this pledgets should be placed between the toes and the bandage

should bring the dressing up against the skin, for example a dressing applied to the instep. After a few days the acute inflammation subsides, the drainage stops and there is visible evidence of epithelial repair.

**Treatment for Subacute Inflammation.** Even here the strong fungicides are contraindicated. However, some of the fungistatic agents can be used, such as carbolfuchsin or methylosaniline. A suitable formula for this is McFarland's<sup>16</sup> (methylosaniline 6 Gm, alcohol 24 cc and water 120 cc). The epidermis is not tough. In fact there may yet be denuded areas. The soaks can be continued each day and followed by a dressing with a mild antiseptic ointment, such as boric acid, ammoniated mercury, or the methylosaniline, followed (after it dries) with simple Lassar's paste and a dressing.

**Active Fungicidal Treatment.** When the skin repairs a change to active fungicidal agents can be considered. The most popular and the one that is most serviceable is Whitfield's formula. All strong ointments that are applied to the feet are preferably applied at night, particularly if it happens to be one containing an essential oil or a substance that is apt to act as a vesicant when the shoes are worn. If the change is made to Whitfield's ointment when the skin is tender, a 50 per cent strength had best be used. A modification of this formula put in liquid form is advantageous for a person who naturally has hyperhidrosis, as it has a drying action and thus inhibits propagation of the fungus. Peck and his associates<sup>17</sup> have shown that some of the organic acids naturally present in the skin act as fungistatics and this is an indication for incorporating into the prescription one of these, such as lactic acid. I feel that it fortifies the efficacy of the combination of salicylic and benzoic acids in a liquid menstruum.

**Foot Powders.** The use of foot powders is of distinct value and they are recommended. They aid in keeping the feet dry. That is one advantage. Another is that if they contain a fungicidal or fungistatic agent a better opportunity is presented for a more continuous application, as perspiration dissolves the medicine. In the shoes they help to weed out the source of reinfection. A serviceable foot powder is the following: thymol 1 per cent, boric acid 10 per cent, zinc oxide 20 per cent, purified talc to make 100 per cent. The use of foot powders containing as much as 3 per cent salicylic acid is contraindicated for soldiers because the salicylic acid adds to the macerating effect of the perspiration and causes a denudation of the epithelium. Thus, it may defeat its purpose in the attempt to prevent a crippling effect of the infection.

**Irradiation.** Roentgen treatments are of distinct value in the inflammatory types of the infection and in the subacute types. They have an antipruritic effect probably faster than any other agent and also a satisfactory sedative effect on inflammation. In fact, roentgen treatments contribute greatly in reducing the duration of the inflammatory stage of the infection. They should be administered in small doses (70 roentgens) at weekly intervals. Larger doses do no more good, nor will oft repeated treatments do any more than weekly treatments. Usually not more than three or four are necessary in the worst cases, and rarely are that many.

necessary provided judicious local care is given. Using roentgen rays with such a plan keeps the dosage well within safety limits. Many have the mistaken idea that roentgen rays are fungicidal and bactericidal. This is not the case. Jacobson<sup>18</sup> experimented with effects of them on cultures of various fungi and concluded that the results of this investigation, while not conclusive, seem to suggest that the beneficial therapeutic effects of roentgen irradiation on the clinical mycoses are largely due to the action of these rays on the tissues primarily, which in turn probably through some intermediary unknown factors of immunity generated in them by the roentgen rays exercise an adverse effect on the infecting parasites *in situ*.<sup>19</sup> Ultraviolet radiation itself has no cumulative value. However, it activates the dyes and with them is of therapeutic benefit.<sup>20</sup>

**Trichophytin.** The use of trichophytin as a therapeutic agent is not yet on a well established basis. Its use as a diagnostic agent, particularly in the handling of vesicular dermatitis of the fingers, is unquestionable. Recent work on the preparation of it may add somewhat to its therapeutic efficacy as an immunizing agent. Peck and his associates<sup>21</sup> have revived the idea that there is a skin reactive factor and an immunizing factor in trichophytin, and they were able to produce either by controlling the pH of the culture medium. Miller's<sup>22</sup> method of preparation yielded a trichophytin which stimulated the production of complement fixing antibodies and precipitins when injected into rabbits, and he stated that it was suitable for use in serologic tests to detect the presence of circulating antibodies in human infections. It is beyond the pale of human imagination to expect that ringworm vaccine will ever replace the need for local medication of the infection.

**Prophylaxis.** Infected nails often serve as a source of reinfection and should receive attention. Avulsion is sometimes recommended though not always necessary. By persistent care and attention, scraping and macerating the infected nail substance and application of one of the commonly used medicaments, it is the usual experience for one to grow off the infected nail. This cannot be accomplished in one whose nails do not grow at a normal rate.

A source of infection in civil life is commonly floors, except in fixed barracks this is not an important source in the Army. The soldier's shoes are his greatest source of reinfection. Many is the time that his shoes do not have time to dry or get an inside cleaning. However, every attempt should be made to sterilize them, according to the opportunity. Formaldehyde is the most efficacious and cheapest.<sup>22</sup> Much of the crippling effects of fungous diseases of the feet can be prevented by sterilization of the shoes and socks, keeping the feet as dry as possible, the use of a foot powder and early treatment of latent infections before the hot season commences.

Of all cutaneous diseases of soldiers, trichophytosis is the most important because of its potentiality of taking him off of his feet.

#### DERMATITIS VENENATA (POISON IVY AND TROPICAL PLANTS)

No better opportunity can be offered for studies on the treatment and prophylaxis of poison ivy dermatitis than the Army on maneuvers. Shelmire<sup>23</sup> and Stratton<sup>24</sup> have indicated that the antigenic principle is the same regardless of the plant (one or more species of which is widespread over the United States). The former has shown by experiments how difficult it is to wash the active principle off of the hands or clothing. The soldier in the field has little opportunity to avoid spreading it over himself by his clothes or other fomites, which accounts for many cases of severe crippling dermatitis. His contact, when it occurs, is usually not a light one. On maneuvers frequently he has to crawl or lie down in the plant, and the practice of camouflage does not permit any selection of leaves in which to hide himself, cannon or truck. The plant vies with gas in producing noneffectives in certain locations.

**Treatment.**—Regardless of the severity of the dermatitis, it is incapacitating to a large percentage of soldiers. The problem is a dual one—treatment and prophylaxis. Patients with severe involvement require hospitalization. Such persons need a complete change of clothing and environment to prevent further inoculations of their skin with the irritant. There are a long list of prescriptions and medicines advised. Calamine lotion is the universal agent used. It is palliative in cases of mild involvement. The ones with a considerable amount of vesicles and bullae require wet packs, and the standard preparations are Burow's, boric acid and potassium permanganate solutions. Subacute irritations are frequently handled satisfactorily by painting with saturated solution of potassium permanganate. It, Castellani's formula of carbolfuchsin and boric acid have antipruritic qualities. A boric acid paste is a good antipruritic. Cold is better than heat in that respect. The selection of the drug used depends a great deal on what is most readily obtainable. In this respect potassium permanganate is the most practical because it is cheap and requires no great amount of room in a medicine kit. Determination of the practicability of sodium perborate ointment<sup>25</sup> as a protective for soldiers needs further study. The probability of its deterioration and the bulkiness of jars of it do seem to rule against its adoption.

The value of injections of the extract of the plant for treatment as well as for prophylaxis is still in a state of flux. Reports on their efficacy are contradictory. Zisserman and Birch<sup>26</sup> studied a group of 1,731 boys at a boy scout camp. Three hundred and four received prophylactic intramuscular injections. The incidence of subsequent poison ivy dermatitis was 51.6 per cent in the treated group and only 33.6 per cent in the camp as a whole. Greenberg and Mallozzi<sup>27</sup> studied a group and found that 27 per cent who were specifically "immunized" contracted poison ivy dermatitis, while it occurred in 36 per cent of those who received control injections. A list of other contributors to the subject

who report good<sup>23</sup> and poor or no<sup>23</sup> results is appended. It is seen that the ones who give encouraging support to the idea that immunizing results can be obtained are Shelmire, Molitch and Poliakoff, and Keeney. Shelmire gave orally ascending doses of a 1:25 or 1:10 dilution of the oleoresin for a period of several months, and he demonstrated varying degrees of reduced sensitivity. The technique that Molitch and Poliakoff used consisted in continuous injections from the first appearance of the poison ivy leaves until the first frost, a period of five months. The dosage was that recommended by Spain and Cooke<sup>30</sup> at intervals of a week. The first dose was 1 cc of a dilution of 1:10,000 with gradual increase in the strength up to 1 cc of 1:500. Keeney<sup>23</sup> recommends protection by taking advantage of the refractory period (six to eight weeks) that follows a positive patch test. Further work is necessary to standardize this procedure. For protecting soldiers in the field it offers the advantage of simplicity and the saving of supplies and administrative details.

Stratton<sup>24</sup> has recommended a standardization of dosage of the extract on the basis of the dermatitis producing activity of an extract on the shaved skin of an animal. He has selected as 'representing 10,000 dermatitizing units that quantity of poison oak or poison ivy extract contained in 0.1 cc of designated solvents which, when applied without cover' to the epilated skin of animals which do not become sensitized, such as the rabbit, rat or mouse, in the form of a stripe (3 cm in length by 6 mm in width) is just sufficient to elicit an erythematous reaction within forty-eight hours." There is need for a standardization of poison ivy extracts. It has been shown by more than one observer that products of the commercial houses vary in their strengths.

Many physicians use one or more of the products in treatment or in an attempt to immunize. Many patients demand it. An occasional dramatic improvement in signs and symptoms is seen, and for this reason if no other, its popularity will continue. A conclusion

should not be drawn regarding immunization unless it is definitely known that the individual actually has had a "clinical exposure." There is still a need for further work to determine what is the best method of hypersensitization to protect a sensitive person from incapacitating attacks of the dermatitis when exposed in an ordinary manner. A plan that is practical would be a valuable contribution to military medicine.

#### TROPICAL PLANTS

In the tropics there are plants which cause irritation of the skin either by hairs, thorns or spines or by their irritating sap. They are listed<sup>31</sup> in the accompanying tabulation.

#### DERMATITIS DUE TO INSECTS

Satisfactory methods of curbing some of the insects have been worked out by military medicine in the past, notably those for pediculosis corporis. The delousing

#### *Tropical Plants Causing Irritation of the Skin*

| Plant                  | Irritating Principle   |
|------------------------|--|
| Spanish nettle (shrub) | Stinging hairs on stems  |
| Cow itch (vine)        | Hairs on seed pods   |
| Panama (tree)          | Hairs of fruit   |
| Acacia (shrub)         | Ants in its spines   |
| Black palm             | Spines of leaf and trunk   |
| Beach appl.            | Sap  |
| Mango                  | Sap  |
| In the Philippines     |  |

| Dumayaka palm          | Hairs on fruit   |
| Fishtail palm          | Hairs on fruit   |
| Lipang kalabao (tree)  | Hairs on leaves  |
| Lipang morado (tree)   | Hairs on leaves and stems  |
| Lipa (tree)            | Hairs on trunk or leaves   |
| Dilano (vine)          | Hairs on leaves and stems  |
| Pungapung (shrub)      | Juice of stem  |
| Ligas (tree or shrub)  | Sap of trunk   |
| Buta buta (tree)       | Latex or bark (a violent irritant—poisonous if taken internally) |
| Panay                  |  |
| Kamanday (tree)        | Sap or trunk (fatal if taken internally)                         |
| Dalit (tree)           | Sap is poisonous internally                                      |

methods used in the last war may again be necessary, but up to date this has not become much of a medical problem.

Scabies is ever present, but its incidence is held down to an inappreciable amount by the monthly physical examinations and isolation practices. Yet when troops are in the field more favorable conditions for its increase arise. Its diagnosis is not difficult except in atypical cases and in them a trained dermatologist can render aid.

There are two insects which in southern United States are particularly voracious and cause no end of trouble in the hot season—chiggers and ticks. Any one who has not had the experience of a generalized intensification of chiggers over his body has not yet tasted one of life's bitterest pills. They give rise to pruritic papules which itch long after the insect has been destroyed. They and the tick bites are the beginning of many cases of pyoderma, which result in a further loss of troops because of hospitalization. The impetiginous and furuncular lesions of tick bites frequently result in small nodular granulomas which involute very slowly and which in some cases undergo exacerbations of itching days or weeks apart. In some instances a cycle of neurodermatitis develops. During the maneuvers of the fall of 1941 there were no patients with Rocky Mountain spotted fever and only 1 with tularemia evacuated from the field to the Station Hospital at Fort Sam Houston. This hospital did not receive any patients evacuated from any Pacific states. How-

ever, in the future, because of the interchange of troops and the rapid transport of them, the spread of diseases ordinarily endemic in certain localities can be expected. The curbing of chigger and tick bites can be accomplished in peace time by burning undergrowth and ground. It will not be done in wartime because of the need of cover. Ticks can be eradicated from the body by picking but not so the little chigger, which cannot be seen even with a lens until he changes his color with engorged red blood cells. A favorite night pastime of soldiers in the field is to pick ticks off of one another. I was told that commonly when a marching column halted last summer every one from the general on down took off his shirt and started picking himself and his clothes. Such a method of eradication is a crude way of protection and medicine should provide a better one. It should be emphasized that protective local applications should not be too bulky and should be easily applied. The application of sulfim and derris root powder is helpful. Application of kerosene or pyrethrum oil to the insect when he has attached himself followed by bathing, is efficacious.

The control of the spread of leishmaniasis, yaws, veruga peruviana as well as the insect borne fevers can be aided by the use of insect repellents.

#### SYPHILIS

Syphilis is handled in the Army by the urologic service, which is a division of the surgical service. Formerly dermatology was a part of the urologic service. In hospitals where dermatology is under the medical service syphilology thus is not a part of dermatology. The opportunity for a dermatologist to do any work on syphilis will depend on the situation, such as the size of the hospital. The incidence of it among inductees is not known and cannot be stated exactly until mobilization is complete. An early report from the Texas State Headquarters for Selective Service in June 1941 showed 2.17 per cent of 3,626 rejections because of the disease. The incidence has been found higher among inductees generally (4.2 per cent). "The admission rate for all venereal diseases for the whole army was 42.5 per thousand strength in 1940 as compared to 29.6 in 1939, an increase of 44 per cent. Eighteen per cent of the cases were syphilis and 72 per cent were gonorrhea. The percentage due to syphilis was slightly lower and that due to gonorrhea slightly higher than has been usual in the past years. The percentage due to chancroid and lymphogranuloma venereum shows little change from 1939."<sup>32</sup>

All patients with the condition in an early stage are hospitalized until the condition becomes noninfectious. The syphilitic register of the Army is very successful and is the ideal method of handling the infected in a manner which will stamp out the disease. The soldier's record of syphilis follows him wherever he goes, it contains his record of treatment, collaborated laboratory tests, pertinent clinical data from the beginning to the time of cure or when the case is closed. Treatment for early syphilis is standardized so that the optimum requires continuous treatment with alternating courses of thirty each of arsphenamine and bismuth injections for one year, with clearance only after the serologic reactions of blood and spinal fluid have become and remain negative for a year. On completion of the optimum treatment the patient is followed up at frequent intervals. Careful physical examination is made after approximately six months and at the

end of the year. The final examination includes an examination of the heart and great vessels.

The technique of massive dose arsenotherapy of early syphilis by the intravenous drip method has not been adopted by the Army. It has promise of its most successful application in the fixed hospitals of the Army because the soldier with syphilis is hospitalized during his infectious period anyway. He could receive his full course of arsenicals during this period. Whether or not this was pursued with follow-up courses of bismuth, the total time lost from service as a result of treatment would be considerably less with this plan of treatment. It also offers savings in the administrative costs of handling the case. The untoward effects such as toxicodermas, liver or kidney damage, encephalitis, neuritis, blood dyscrasias and nitritoid reactions are contrary to what was at first expected—surprisingly mild or nil. The fatalities from the treatment in Leifer, Chargin and Hyman's<sup>33</sup> series was one death among 382 cases (0.25 per cent), and five deaths (0.3 per cent) among 1,600 cases reported by Elliott and the U. S. Public Health Group.<sup>34</sup> It gives promise of curing 83 per cent. If current expectations from the studies hold up, it may become a standard procedure for all clinics. However, it is still considered to be in the experimental stage and is not adopted by the Army.

#### DERMATOLOGIC THERAPY

The treatment of dermatologic conditions in the Army is distinctly different than in civil life. It will be variable, dependent on whether in the field or in the hospital and the size and location of the hospital. In the smaller dispensaries treatment necessarily has to be simple, and if it is not effective the patient has to be evacuated to a station or general hospital. The dermatologic work is placed as a separate section under the medical service in hospitals large enough to make a special service practicable. Dermatologic therapy calls for resourcefulness, as the dermatologist will not find every convenience and modality to which he has become accustomed in his civilian practice. His allergy studies will be handled by another department and his radiation therapy will be delegated to still another department. His local applications will depend on what is a standard drug for the Army. He will have to plan his technique of treatment based on general principles (such as reducing agents and soothing agents available).

The chief difficulty will be the choice of a proper base. What is an ideal base is not generally agreed on, however, it is generally agreed that bases containing emulsifying agents make more effective ointments.<sup>35</sup> The selection of it would depend on what is available. It should be as simple as possible and not require much time in processing. I have used a base containing 5 per cent Duponol in hydrous wool fat and petrolatum and have demonstrated its repeatedly increased efficiency over plain petrolatum, with no sensitivity to it. Another suggested one is diglycol stearate 10 per cent, white wax 3 per cent, cetyl alcohol 3 per cent, petrolatum 4 per cent, glycerin 4 per cent and water 100 per

Dermat. & Syph.* **12** 264 (Feb.) 1941.

cent. It costs little more than plain petrolatum. Recently 50 cases were subjected to make patch tests with this base without a reaction. If one wants a greaseless base or cream, the formula of Remington<sup>36</sup> is suitable. It contains only one drug that is not standard on the Army drug list namely stearic acid. Diglycol stearate mixed with water to suitable consistency also serves as a greaseless cream. One pound (450 Gm.) of it will make 10 pounds (4,500 Gm.) of base (cost \$1).

Dependent on the volume of cases, the technique of treatments will vary. In large groups of men have to be handled in a short length of time the treatment may have to be given in a wholesale manner.

Whatever methods are adopted, the prime motive cannot be lost, and that is to dispose of the patient as expeditiously as possible—either back to duty or to a place where he will not interfere with the efficiency and mobility of the military machine. If his condition is one that is recurrent and necessitates frequent hospitalization (i.e. atopic dermatitis, or dermatitis herpetiformis), the Army has no use for him. Cases falling into this category require discharge from the service.

#### RESEARCH

The physician in the Army is constantly faced with research problems. Many times his duties or his location will not allow the prosecution of them. His attention may be taken with administrative problems, little time for study being left. Or in other situations time may hang heavy on him. In either instance, his contributions to medicine will call for a little more effort than in civilian life. Since this is a world war, many will be stationed where there will be opportunities for them to gain first hand knowledge of diseases rare in their homeland. One may be stationed in a leprosy country, another in South America, where he will see chromoblastomycosis. Some may get a wide experience with yaws. Will one see the Aleppo boil as commonly as one does impetigo in this country? And likewise the opportunity of comparing the American form of leishmaniasis? Pinta may be experienced by the New Yorker, and verruga peruana by the Californian. The prospects for a wide experience in medicine for the Army medical officer are limitless and call for an unlimited fund of knowledge.

There is danger of American medicine losing many of its gains as a result of the war. All must strive to keep up the standards of modern achievements. This idea is best expressed by Skinner<sup>37</sup> "When the sources of learning, science and culture are dried up by war, not only the professors and fellows are lost to progress but the great groups of students in their wakes are lost to the future. War not only grinds future soldiers, citizens and even children in the dust but it creates a dust bowl that future generations must refertilize and cultivate before any scientific spirit and accomplishment can sprout again. Moreover, when frontiers are closed by war there is no longer that comradeship of scientists that provokes useful adventures through the exchange of ideas and of literature. The whole world would halt in what we hope is useful progress if the flame of science were not kept lit somewhere, somehow. Unfortunately, science and culture cannot bivouac for an intellectual rest. Science must be kept nourished by thoughts and ideas that have no

place to develop amidst the terrors of warfare. One cannot establish a blackout for science for the duration and then expect it to flourish when the bombing is over. This is especially true in the total war that is now the world's fashion." All other sources of medical knowledge are dammed up, and there is now more than ever the urgent need for America to keep alive the continued interest and progress of scientific medicine. American dermatology has made great strides since the establishment of the Broome Street Infirmary for Diseases of the Skin by H. D. Bulkley and John Watson in 1837.<sup>38</sup> Let us hope that none will be lost and that, despite the handicaps thrust on us by the present war, American dermatology will continue its contributions to medicine. This is a challenge to all—both those in the military service and the ones who are carrying on at home under added burdens.

## THE INCIDENCE OF NUTRITIONAL AND VITAMIN DEFICIENCY

A SURVEY OF PATIENTS ENTERING STANFORD UNIVERSITY HOSPITAL

MARCUS A. KRUPP, M.D.

SAN FRANCISCO

The importance of adequate nutrition in maintaining the health of the nation has been clearly brought to the fore by the war emergency. But while good nutrition must be implemented and any indifference to this paramount problem must be overcome, it is obviously necessary, in order to work intelligently, that the true needs of the situation be understood as fully as possible. Although many studies have already been published, it is

TABLE 1—Relation of Adequacy of Diet to Social Rating and to Clinical Signs of Vitamin Deficiency

|   |             |               |                 |
|---|-------------|---------------|-----------------|
| Total patients                            | 385         | (100 %)       |                 |
| Total with vitamin deficiency disease     | 12          | ( 3.1 %)      |                 |
| Total with good social service rating     | 248         | ( 64.4 %)     |                 |
| Total with poor social service rating     | 37          | ( 9.6 %)      |                 |
| Total with adequate diet                  | 297         | ( 77.1 %)     |                 |

[illegible]

part low or low middle income groups. As a rule they came for the diagnosis of medical complaints, thus there was frequently a definite chronic disease in addition to poor diet, so that a high incidence of deficiency disease might be expected. The subjects lived not only in the San Francisco Bay region but often in other parts of the state. This study, made during the fall and winter of 1940-1941, includes consecutive entries. The only persons omitted were moribund patients or those with a language difficulty which rendered accurate history taking impossible. All patients received the general thorough "workup" which is carried out in a teaching university clinic, in addition to the special nutritional

dietary history. Many subjects remember poorly or become fatigued during a long inquisition and answer carelessly, some seem to say what they think the doctor wants them to say, and finally there is the great difficulty of accurate estimates of amounts. The problem is further complicated by the duration of time during which the diet has been deficient: acute versus chronic deficiency. Be this as it may, the results of the present survey are given in table 1.

Points to be emphasized are, first, that the diet seemed inadequate in 22.9 per cent, or nearly one fourth of the whole group (although in some cases the deficiency was slight or pertained only to one category of

TABLE 4—Cases of Definite Vitamin Deficiency

| Case | Age and Sex | Occupation        | Disease Diagnosed  | Dietary Deficiency  | Signs of Vitamin Deficiency  | Comment  |
|------|-------------|-------------------|--|---|--|--|
| 1    | 78<br>♀     | None              | Cancer of stomach proved by gastroscopy  | Severe: little food little dairy products meat and greens no fruit                              | Cheilosis dry skin sore tongue weakness numbness paresthesia and difficulty in walking   | Impression neuritis associated with vitamin B deficiency   |
| 2    | 70<br>♂     | None              | Cancer of stomach  | Quantity of food low especially in greens otherwise seems adequate vitamin supplements for 2 yr | Weakness dry itching skin severe glossitis and moderate neuritis of peripheral type  | Clearcut vitamin deficiency multiple especially thiamine and nicotinic acid  |
| 3    | 64<br>♀     | None              | Tie douloureux angina pectoris   | Adequate except for little milk   | Severe cheilosis with dry skin   | Definite riboflavin deficiency cleared up on riboflavin administration   |
| 4    | 42<br>♂     | Cook (unemployed) | Hypoproteinemia with edema paratyphoid infection possible hepatitis achlorhydria | Not certain but probably generally deficient  | Edema serum protein 5.4 Gm. per 100 cc   | Edema and low protein content of blood may have been related to vitamin deficiency got well on high protein high vitamin diet                      |
| 5    | 74<br>♂     | Clerk             | Coronary disease cancer of thyroid with metastases                               | Deficient in total amount and especially in dairy products                                      | Red smooth tongue fissuring at angles of mouth weakness and emaciation   | Definite mild vitamin B deficiency (especially riboflavin and nicotinic acid?) not improved by large doses of vitamins desperately ill from cancer |
| 6    | 32<br>♂     | Laborer           | Functional indigestion   | Diet seems fairly adequate except no whole grains and low in meat                               | Moderate cheilosis and some roughening of skin over nose   | Mild riboflavin deficiency improved promptly after taking riboflavin   |
| 7    | 56<br>♂     | Laborer           | Cancer of lung pleural effusion  | Except for meat diet is low in all components   | Slight glossitis dry skin and weakness   | Symptoms probably partly due to cancer but probably a mild B deficiency  |
| 8    | 50<br>♂     | Cook              | Desperately ill with pyloric stenosis from cancer                                | Vomiting for 4 months has retained no food  | Emaciation edema mild shark skin nose and moderate glossitis serum proteins 3.3 Gm per 100 cc some signs appeared after dextrose given intravenously | Edema and low protein content of blood possibly due in part to vitamin deficiency mild vitamin B deficiency  |
| 9    | 66<br>♀     | None              | Gastritis malnutrition edema anemia  | Low in calories possibly poor absorption and anaemia for 10 yr with diarrhea                    | Edema anemia weakness and dry skin serum protein 4.7 Gm. per 100 cc  | Vitamin deficiency doubtless plays a part no specific diagnosis  |
| 10   | 65<br>♀     | Housework         | Vitamin deficiency rheumatoid arthritis  | Diet scant in vitamin B foods occasional orange bit of fish or egg half pint milk daily         | Severe anorexia glossitis and sore gums malnutrition weakness and insomnia   | Definite mild vitamin B deficiency   |
| 11   | 52<br>♂     | Musician          | Chronic amebic colitis diarrhea for several years                                | Low in calories cereals and greens  | Edema low protein content of blood and malnutrition glossitis  | Certainly deficient in vitamin B as well as in proteins  |
| 12   | 19<br>♂     | Student           | Acute ulcerative colitis   | Diet good but 9 weeks of severe diarrhea  | Weakness numbness and paresthesia of feet  | Mild vitamin B deficiency associated with diarrhea   |

history, which was taken in every case according to the outline presented as table 2.

Evidences of vitamin deficiency were checked on a special sheet (table 3) on which a survey of various symptoms and lesions and the specific vitamin alleged to be implicated was detailed. It was realized that some parts of the list were probably inaccurate, it was based on statements in the literature as of August 1940.

No chemical tests of vitamin saturation or excretion were made. It was felt that these cannot yet be fully interpreted in relation to clinical vitamin deficiency disease.

#### RESULTS

1 *The Incidence of Defective Diets in the Present Group*—One thing that one soon learns in work of this sort is the difficulty of obtaining a really satisfactory

foods), and second, that the incidence of poor diet was much higher in the lower income group than in those with a better social service rating (46.0 per cent as against 20.7 per cent).

2 *Incidence of Clinical Evidence of Vitamin Deficiency*—No case of full blown scurvy, beriberi, pellagra or keratomalacia was encountered. There were 4 instances of edema probably caused in part at least by poor diet. There were 12 cases, or 3.1 per cent of the whole group, in which definite but minor signs of clinical deficiency were noted. These cases are summarized in table 4. It is of note that some component of the vitamin B complex usually seemed to be lacking, and perhaps this is to be expected, as the early and minor stages of vitamin A and vitamin C deficiency show little in the way of evident clinical signs. There

were in addition 17 cases in which possible mild signs of vitamin deficiency were made out (table 5). Adding these to the definite cases one gets a total of definite or suspected deficiency disease in 29, or 75 per cent of the whole group.

3. *Relation of Deficiency Disease to Defective Diet*—The data are summarized in table 1 and show what one might expect: only an occasional patient with apparently normal diet gave evidence of vitamin deficiency, while about 20 per cent of those with inadequate diet had definite or suggestive clinical signs.

factory in southern California had clearcut evidence of one or more sorts of vitamin deficiency. It is on this account that many more accurate surveys should be made in various parts of the country. Be this as it may, it is quite clear that in the group herewith reported on the occurrence of clinical signs of vitamin deficiency was extremely low, even though many of the subjects were ill with diseases which might promote poor nutrition. It is of interest that there was an extremely good correlation of positive signs of deficiency with history of inadequate diet, which shows that even with a serious

TABLE 5—Cases of Doubtful Deficiency Disease

| Case | Age and Sex | Occupation | Disease Diagnosed  | Dietary Deficiency  | Possible Signs of Vitamin Deficiency  | Comment  |
|------|-------------|------------|--|---|---|--|
| 1    | 31          | Printer    | Duodenal ulcer   | No definite deficiency except that it times is on milk diet   | Questionable magenta tongue, riboflavin deficiency?   | Very doubtful if any clinical deficiency has been demonstrated                             |
| 2    | 52          | None       | Cirrhosis of liver, advanced                                 | Diet seems adequate *   | Bruising, sore gums and weakness  | Very doubtful if these symptoms are specific of vitamin deficiency                         |
| 3    | 76          | None       | Gastric ulcer for years, verified at operation               | Total intake low, especially in fruits, greens and meats  | Undernutrition and dry skin, slight reddening of buccal mucosa noted by one examiner                                    | No specific evidence of vitamin deficiency   |
| 4    | 76 ♀        | None       | Bronchitis asthma, very severe death                         | Diet adequate (history obtained from husband)   | Ankle jerks not obtained vibratory sense diminished over ankles position sense absent in toes, tenderness of right calf | Possibly a very mild neuritis (vitamin B <sub>1</sub> deficiency?)                         |
| 5    | 76 ♀        | None       | Tuberculosis of lung, pleura and pericardium active          | Total calories low citrus fruits, whole wheat and meat low  | Dryness of skin, slight reddening of buccal mucosa, malaise, weakness, insomnia and irritability                        | Possible mild vitamin B deficiency but symptoms probably from tuberculosis                 |
| 6    | 63 ♀        | None       | Hypertension and anorexia nervosa                            | Diet generally low in calories no milk only small amounts of fruit and vegetables no meat, for a while took yeast | Malnutrition, weakness, irritability, insomnia and mild gastrointestinal disturbance                                    | In spite of poor diet has no specific signs of vitamin deficiency                          |
| 7    | 31 ♂        | Butcher    | Duodenal ulcer   | Adequate in meat and dairy products low in fruits, greens and cereals   | Smooth tongue, indigestion, occasional nausea and vomiting  | Questionable mild vitamin B deficiency   |
| 8    | 42 ♀        | None       | Diarrhea and an acidity                                      | Total calories low otherwise diet seems adequate, but diarrhea may have caused absorption                         | Dry skin, weakness, malnutrition, irritability and slight macrocytic anemia   | Questionable signs of specific vitamin deficiency  |
| 9    | 69 ♂        | None       | Hypertension with metastasis                                 | Diet seems adequate   | Slight smoothness of tongue   | Questionable mild vitamin B deficiency   |
| 10   | 56 ♂        | None       | Arteriosclerotic heart disease, pyloric stenosis, neoplasms? | Low in total calories otherwise diet seems adequate   | Undernutrition, weakness, irritability and insomnia   | Not definite for any specific deficiency   |
| 11   | 62 ♂        | Caretaker  | Dementia paralytica  | Low in dairy products and cereals   | Slight glossitis  | Possible mild vitamin B deficiency   |
| 12   | 64 ♀        | None       | Rheumatic heart disease                                      | Low total intake, especially greens and meat  | Underweight weakness nervousness and anorexia   | Very doubtful mild vitamin B deficiency  |
| 13   | 34 ♂        | Plumber    | Hodgkin's disease  | Low in total amount, otherwise diet seems normal  | Glossitis, weakness and malnutrition  | Symptoms probably mainly due to Hodgkin's disease but tongue improved on vitamin B therapy |
| 14   | 57 ♂        | Molder     | Gastric ulcer  | Low in milk, fruits, greens and cereals   | Dry skin and some redness of tongue   | Very questionable mild vitamin B deficiency  |
| 15   | 55 ♂        | Farmer     | Gastric ulcer  | Diet seems adequate low total calories  | Slight cheilitis and dry skin   | Questionable vitamin B or A deficiency   |
| 16   | 75 ♀        | None       | Old age  | Not remarkable, perhaps low intake  | Slight redness and smoothness of tongue   | Very doubtful slight vitamin B deficiency  |
| 17   | 65 ♂        | Miner      | Coccidioidomycosis   | Low in calories and in all high vitamin foods   | Weakness, edema indigestion and dry skin  | Possible mild vitamin deficiency cannot define it definitely                               |

\* This patient probably had deficiency of vitamin K

COMMENT

Recent surveys of vitamin deficiency disease have on the whole shown a disturbingly high incidence.<sup>1</sup> Most of these reports have been made by careful well trained investigators, and the results seem dependable. However, it is important to take into account the locality in which the survey is made, the particular population group and the criteria for diagnosis. Some of the statements made in the lay press, on the other hand, must be interpreted with caution, such as those claiming that 50 per cent of the employees in a certain

disease, such as cancer, hepatitis and arteriosclerosis, deficiency disease does not readily supervene provided the diet remains adequate.

One of the most important practical aspects of nutritional disease is the question of variation in resistance to vitamin deficiency. It is well known that people do not all develop clinical signs with equal readiness, in many cases extremely poor diets may be tolerated for long periods before clinical evidences of disease occur.<sup>2</sup> This is well illustrated in the present study. As pointed

1 Jolliffe, Norman, McLester, J. S. and Sherman, H. C. The Prevalence of Malnutrition, J. A. M. A. 118: 944 (March 21) 1942

2 Brenner, S., and Roberts, L. J. Effect of Vitamin A Depletion on Young Adults, Federation Proc. 1: 188 (March 16) 1942. Williams, R. D., and Mason, H. L. Observations on Induced Riboflavin Deficiency in Man, ibid. 1: 192 (March 16) 1942

out in table 1 among 88 persons with defective diet only 11.4 per cent showed clinical signs of deficiency.

It is necessary to emphasize again some of the problems involved in surveys of this sort. First, the eliciting of a satisfactory accurate dietary history is at times difficult if not almost impossible and second, the judgment as to whether minor but yet specific signs of vitamin deficiency exist must often be uncertain. How much stress can be placed on vague symptoms of weakness, fatigue, insomnia, poor appetite and so on? What is the significance of a little dryness or roughness of the skin or a slight eczematoid condition at the nasolabial fold? Even the therapeutic test is often difficult to interpret in persons with such dubious phenomena. Finally if some of these minimal signs are the results of vitamin lack, how serious are the implications? These and many other questions still require careful evaluation.

SUMMARY

1. A survey was made of approximately 400 consecutive patients admitted to the clinic wards of Stanford University Hospital with reference to inadequate diet and signs of vitamin deficiency.
2. Approximately one fourth of these patients had been taking an inadequate diet.
3. Of those with inadequate diets 11.4 per cent showed definite signs of vitamin deficiency.
4. Among 297 patients with adequate diets, only 2 instances of clinical vitamin deficiency were detected.
5. In the entire group the incidence of definite vitamin deficiency disease was 3.1 per cent.

# CARDIAC RESUSCITATION

WITH REPORT OF A CASE OF SUCCESSFUL  
RESUSCITATION FOLLOWING AURICULAR  
AND VENTRICULAR FIBRILLATION

SAMUEL A. THOMPSON, M.D.  
GEORGE L. BIRNBAUM, M.D.  
AND  
IRVING S. SHINER, M.D.  
NEW YORK

Up to the present time cardiac resuscitation has usually been attempted on patients who die in the operating room. With the increased knowledge of the physiology of the cardiorespiratory system and improvement in equipment, the possibility of cardiac resuscitation outside the operating room and particularly in warfare should become a reality. Being prepared for such occasions by having a definite plan of treatment and suitable equipment will result in a greater number of successful cases.

It is our purpose in this paper to review some of the methods of cardiac resuscitation, to present experimental and clinical evidence of the value of certain resuscitation procedures, to present a plan of treatment for cardiac or, better called, cardiorespiratory resuscitation and to report a case of successful resuscitation following auricular and ventricular fibrillation.

The physiology of the cardiovascular system and that of the respiratory system are so intimately connected and interdependent that changes in the functioning of one system are almost immediately registered by changes in the other, and, regardless of which was the

site of the original dysfunction, cessation of the function of one will quickly lead to cessation of the other. In attempting resuscitation it should be remembered that it is necessary to revive the cardiovascular as well as the respiratory system, since one cannot survive without the other.

The brain and the heart are the most sensitive of all the vital organs to anoxia, and permanent changes occur

Efficiency of Different Resuscitative Procedures

|  | Oxygen | Success | Failure | Success<br>per Cent |
|--|--------|---------|---------|---------------------|
| 1 Manual artificial respiration                  | 6      | 5       | 55      |                     |

in the central nervous system from anoxia long before they do in other organs.

During severe anoxia permanent injury to the brain may occur within five to eight minutes, and if resuscitation is to be complete and permanent oxygenation of the brain cells is vital. Therefore adequate pulmonary ventilation is the first prerequisite in cardiac resuscitation and should be established immediately. Proper pulmonary ventilation may prolong the period of possible resuscitation beyond the five to eight minute limit and give more time for the restoration of the cardiac activity.

There are many ways of establishing pulmonary ventilation, the most important of which are manual artificial respiration, mouth to mouth insufflation and various mechanical resuscitators, some of which operate on a positive pressure and release principle and others utilize a positive pressure inflation together with a negative pressure deflation. Using the "asphyxial resuscitation"<sup>1</sup> test we have shown that the mechanical resuscitators which employ safe alternating positive and negative pressures (suck and blow) are the most efficient and successful and this method is far superior to any other method of pulmonary resuscitation, as shown in the accompanying table. It is probably unnecessary to mention the importance of an unobstructed airway with any method of resuscitation.

The beating of the heart after death on mechanical stimulus has been known since the time of Vesalius, and the rationale of all cardiac resuscitation procedures is based on the fact that cessation of cardiac activity does not mean that the heart muscle is dead. By the very nature of its specific tissue the heart can be made to contract long after the death of the patient.

Kountz,<sup>2</sup> in a series of 127 remarkable perfusion experiments after death, was able to revive 65 human hearts, and of these 65, 48 (73.8 per cent) developed regular cardiac mechanism and beat for a period of two hours.

Acute cardiac cessation is conveniently classified into two groups: (1) arrest of stimulus formation, or the

so-called pacemaker failure, the result of which is cardiac standstill, and (2) electrodynamic dissolution of the cardiac cycle, of which ventricular fibrillation is an example

Any attempt at cardiac resuscitation is always justified, and many such attempts have been successful even after considerable periods of inactivity have elapsed. Adams recently reported a twenty minute cardiac arrest with complete recovery.<sup>3</sup> It is our belief that a surprisingly large percentage of successful results will follow early and properly applied methods of cardiac resuscitation.

Among the many methods that have been reported as being successful in reviving the heart are sudden pressure on the heart made by sharp blows over the precordium, intravascular injections, intracardiac injections, mechanical stimulation by the insertion of a needle into the heart, electrical stimulation applied directly to the heart, mechanical inflation and deflation (suck and blow) of the lungs (experimental) and cardiac massage. The value of some of these procedures is quite clear

since, from the use of many different drugs. It is probable that the success in some instances was due in part, if not entirely, to the mechanical stimulation of the needle prick. Epinephrine is probably the most efficacious of the drugs used. In circumstances in which intracardiac injections might be employed, the absence of a drug should not deter the operator from attempting to stimulate the heart mechanically by inserting the bare needle into the myocardium. This mechanical injury to the muscle fibers sets up a reaction called an "action current of injury,"<sup>5</sup> which in turn causes a contraction or extrasystole, and restoration of the normal pacemaker function may be the result.

The site of the injection is very important and should be in the right auricle for the following reason.<sup>6</sup> As the anoxia of the heart muscle increases the irritability increases, and any stimulus sufficient to develop an action current of injury may lead to flutter and then fibrillation. If the site of the injection is in the ventricle, then ventricular fibrillation may occur, which is incompatible with life. If the injection is in the auricle

Fig 1—The phenomena of asphyxial resuscitation. Nitrogen inhalation asphyxia is produced by way of a leak proof intratracheal tube. After cessation of respiration and in the period of cardiovascular changes with a rapidly falling blood pressure, the lungs are rhythmically inflated and deflated with the same nitrogen which had just produced the asphyxia by means of a mechanical resuscitator of the suck and blow type. A, inhalation of 100 per cent nitrogen, this is the period of dyspnea. B, at the beginning of this period respirations have ceased, the blood pressure begins to fall. C, the heart beat is slower and somewhat irregular, and the blood pressure is falling rapidly. D, nitrogen resuscitation is started, as previously described, two and three quarter minutes after respiratory cessation. The blood pressure continues to fall and approaches zero. Approximately one and three quarter minutes after nitrogen resuscitation was started there was resuscitation of the cardiovascular system as shown by the sudden and continued rise of the blood pressure. Spontaneous respirations occurred later, and use of the resuscitator was discontinued. The intratracheal tube at the end of D is exposed to the atmospheric air for the first time since nitrogen inhalation was started, approximately eight and one half minutes. E, recovery.

and the value of the others is less obvious. The danger of any of these measures is of little account when the patient is, to all intents and purposes, already dead.

Cordelli<sup>4</sup> was able to induce cardiac contractions by repeated sharp blows over the precordium. This method is undependable and should be used only for a few seconds and while waiting for instruments and equipment before proceeding with some other method.

Intravascular injections are of no value when there is no movement of the blood stream. In conjunction with cardiac massage, however, it is likely that these drugs are moved on toward the heart and brain and may have some beneficial effect.

The first intracardiac injection in the human being was done early in the nineteenth century, and many cases of successful resuscitation have been reported

and auricular fibrillation occurs, this is not incompatible with life and will respond to therapy.

Approach to the right auricle is through the third or fourth intercostal space on the right side, close to the sternum, and the needle is inserted in a downward and inward direction. The needle should be about 4½ inches long and reasonably stout. The possibility of injury to a coronary vessel during the intracardiac injection is small but definite, and if successful resuscitation occurs the patient should be observed for some time afterward for this possible occurrence.

Hyman<sup>7</sup> has shown the value of electrical stimulus applied directly to the right auricle and has developed

an 'artificial pacemaker' for use in cardiac standstill due to paralysis of the sinus node or arrest of stimulus formation

Mechanical inflation and deflation of the asphyxiated dog's lungs has a massage effect on the heart and acts as a cardiovascular resuscitator. This is not due to the stimulating effect of oxygen, since cardiac resuscitation can occur from the inflation and deflation of the lungs with an asphyxiating gas (fig 1). This active inflation and deflation of the lungs (using air or oxygen) is also the best manner of establishing and maintaining pulmonary ventilation.

In our animal experiments we have repeatedly found that manual massage of the heart is the most successful single procedure in reestablishing the normal heart contractions (figs 2 and 3), and whenever this is possible in human beings it should be done. As a resuscitation method, cardiac massage was employed even before intracardiac injections. The earliest experience was in 1874, and one of the outstanding successes was reported by Lane in 1903.<sup>8</sup>

The approach to the heart for massage may be any of the following: (1) thoracic (a) transpleural or (b)

through the local injection or topical application of procaine hydrochloride at the sites where these reflexes originate particularly during operative procedures around the arch of the aorta, at the hilus of the lung, on the heart itself and during the insertion and removal of an endotracheal tube<sup>9</sup> (fig 4).

Actual cardiac resuscitation must be done quickly and with a definite plan in mind, since valuable time may be lost when no plan is followed.

First and most important is the establishment and maintenance of proper pulmonary ventilation. This is best accomplished by a mechanical resuscitator using safe positive and negative pressures. Many operating rooms, however, are not equipped with such resuscitators, and the next best method is inflation and release of the lungs by making pressure on the anesthesia bag. This pressure should not be violent or excessive, as it is unnecessary and may damage the alveoli.

When cardiac cessation follows civilian injuries or in warfare, there is usually no resuscitation apparatus of any kind available, so manual artificial respiration should be started at once.

Fig 2—Resuscitation by the use of the resuscitator together with direct massage of the heart through the open chest. Mechanical obstruction asphyxia. A respiration ceases. B to C manual artificial respiration with oxygen inhalation unsuccessful. C resuscitator with oxygen started. Chest opened in the midline and direct heart massage started at D and continued to E where regular heart beats resume. F resuscitation discontinued. G spontaneous respiration.

extrapleural or (2) abdominal (a) subdiaphragmatic or (b) transdiaphragmatic. The approach will be determined somewhat by the operation or circumstances present at the time of the cardiac cessation. If a thoracic operation is in progress the thoracic approach should be used, and if an abdominal operation is in progress the abdominal approach should be used. When no operation is being done the abdominal approach is desirable for several reasons: the thoracic approach takes longer, with the thoracic approach a closed system of pulmonary ventilation is necessary to overcome the effect of the open pneumothorax, and with the abdominal approach it is possible to establish manual artificial respiration if no other method is available. In case of ventricular fibrillation, direct exposure of the heart by the thoracic approach is preferable.

There is a definite place for prophylaxis of cardiac cessation. This is done by the preoperative injection of drugs that decrease the sensitiveness of the heart to vagal stimulation, particularly atropine, and by the attempt to eliminate or decrease the vagal reflexes

In thoracic operations with the chest open, cardiac massage can be easily and quickly done by grasping the heart and gently squeezing the ventricle, thus producing an artificial systole. If there is no response of the heart after one minute, the pericardium is opened and the massage is continued, producing about sixty artificial systoles to the minute. In this way with proper pulmonary ventilation the blood can be oxygenated and moved on to the heart muscle and the brain cells, and the extreme need for haste is now over. After another minute of massage and no cardiac contraction, 1 cc of epinephrine (1:1,000) is injected into the chamber of the right auricle. If no epinephrine is available at the moment, the wall of the right auricle should be stuck with the bare needle. This mechanical stimulation may be sufficient to start the heart contracting. If an electrical apparatus or the "pacemaker" type described by Hyman is available, it should be used as soon as possible. This is also applied to the right auricle for best results. If the cause of the heart standstill can be determined and is still active (ligature

around the bronchus) it should be relieved, otherwise resuscitation may fail

These measures are all used in conjunction with cardiac massage, and if the heart muscle is felt to "limp up" and begin to contract the massage is immediately discontinued. When no contraction has occurred after six to eight minutes, the routine just described is repeated. Artificial systole plus pulmonary oxygenation will sustain life for a long time, and the massage should not be abandoned as a failure until a forty-five to sixty minute period has elapsed.

When cardiac standstill occurs during an abdominal operation the first step is to insure pulmonary ventilation by the measures previously described or by manual artificial respiration if necessary. A few sharp thumps with the closed fist are administered over the precordium as soon as possible, as this mechanical stimulation may start the heart beating. In the meantime the operator should slip one hand under the diaphragm just beneath the heart. The abdominal incision is enlarged if necessary and cardiac massage is begun by pushing up on the heart against the anterior chest wall. If no heart

When cardiac standstill occurs following injuries in civilian life or in warfare the possibility of successful resuscitation is remote, as there is usually no available apparatus for pulmonary ventilation or for cardiac resuscitation. However, a definite routine should be followed. If a resuscitator is available it is applied immediately, otherwise manual artificial respiration is begun. A few sharp thumps with the closed fist are administered over the precordium. If epinephrine is available, 1 cc (1:1,000) should be injected into the right axilla, as previously described. If no epinephrine is available but a needle is, the needle should be inserted into the right axilla. The use of an artificial pacemaker at this time may be life saving. If no response is obtained in two or three minutes, a paramedian incision is made high up on the left side, beginning at the angle of Larrey, and this is carried through into the peritoneal cavity. The operator's hand is slipped under the diaphragm, and cardiac massage is started by pushing up on the heart against the anterior chest wall. The latter procedure cannot always be done under aseptic conditions, however, one must remember that

Fig. 3—Resuscitation by external heart massage. A nitrogen inhalation asphyxia through a leak proof intratracheal tube was started. B to C, asphyxial gasps. C to D, resuscitator with nitrogen was used. D, nitrogen discontinued and resuscitator continued with oxygen. E to F, external heart massage. F, heart beats have resumed. G, spontaneous respiration.

contractions occur after one minute of massage, the diaphragm and the adjacent pericardium are incised wide enough to admit one hand, and cardiac massage is continued. The same routine which was described for cardiac cessation in thoracic operations is now applied.

In going through the diaphragm it is important to avoid opening the pleura, unless provision has been made for a positive pressure pulmonary ventilation. Nicholson<sup>10</sup> recommends the following procedure in the abdominal approach for cardiac massage, since he says only the tip of the heart is compressed.

An opening is made with a knife or a pair of scissors just behind the xiphoid process, between the attachments of the two sides of the diaphragm. There is a soft avascular spot here, and no damage is likely. The thumb of the right hand is thrust through this opening and is now in the pericardium anterior to the heart. The heart is then compressed between the thumb, which acts by fixing the heart and preventing it slipping, and the fingers outside the diaphragm.

It is quite unnecessary to suture the hole in the pericardium.

there is only one degree of death, and that is complete. The manner of its occurrence is immaterial, and any procedure that may obviate its occurrence is always permissible. Therefore time rather than asepsis is the essence of success.

The theoretically perfect setup for the treatment of cardiac cessation in warfare or civilian defense would be a "field resuscitator" with safe alternating positive and negative pressures which could be worked by a hand or foot pump, using ordinary air. This resuscitator should be light (weighing from 8 to 10 pounds) and small enough to be part of the standard equipment of each first aid station and to be carried along by stretcher bearers. Attached to this resuscitator should be a small artificial pacemaker of the type described by Hyman. This pacemaker need be no larger than a pocket flashlight and should contain batteries and a sterile needle electrode. With such a setup the first aid administrators would be able to attempt cardiac as well as respiratory resuscitation.

In many instances it may be clinically impossible to determine whether the cardiac cessation occurred as a result of standstill or ventricular fibrillation. In those

<sup>10</sup> Nicholson, John C. Cardiac Massage, Brit M J 2 385 (March 21) 1942

instances in which the differential diagnosis is impossible the routine which has been described should be followed since fibrillation accounts for a smaller number of deaths.

When it is definitely known that ventricular fibrillation exists an entirely different routine is necessary. Here again it is imperative to establish pulmonary ventilation immediately as the following routine requires direct exposure of the heart and the use of an electrical defibrillator. Exposure of the heart if not already accomplished requires a certain amount of time, and not every operating room is equipped with a defibrillator, therefore the percentage of successful resuscitations in ventricular fibrillation will be small.

In 1899 Prevost and Batelli<sup>11</sup> demonstrated the ability to produce a cessation of ventricular fibrillation in the experimental animal's heart by the direct application of an electric current to the ventricle. More recently Beck<sup>12</sup> has devised and used a defibrillator. With this apparatus he shocks the heart producing a definite cessation of the fibrillation and ventricular contraction or standstill. The heart is then shocked or massaged to produce the normal automatic contractions.

In ventricular fibrillation the most efficient method of resuscitation according to Beck<sup>12</sup> consists in the use of intracardiac injection of procaine hydrochloride followed by an electric shock. The method recommended by Beck is as follows:

Five cc of 2 per cent procaine is injected into the cavity of the right auricle or right ventricle. Massage of the heart moves the drug through the lungs left side of the heart, aorta coronary arteries and myocardial bed. Two large electrodes of metal are placed one on each side of the heart and a shock of one to one and one-half amperes is sent into the myocardium. The current is ordinary electric light current with sufficient resistance in the current to reduce the amperage. The current is made and then broken after a fraction of a second. Not infrequently the fibers go back into the state of fibrillation and the shock must be repeated. [If no contraction occurs] 1 cc of epinephrine is used.

The heart is again shocked. [If no contraction occurs] 1 per cent calcium chloride in doses of 5 cc [is] injected into the cavity of the right ventricle.

The heart can be defibrillated. These methods are effective. It may require several attempts but if conditions are proper, such as the amount of oxygen the tonus of the heart muscle and the irritability, the coordinated beat can be restored.

Scherf<sup>13</sup> has shown in animal experiments that ventricular fibrillation can be terminated by the intracardiac injection of a 1 per cent solution of potassium chloride. He<sup>14</sup> recommends the use of a 1 per cent solution of potassium chloride in human beings by intracardiac injection plus cardiac massage. The initial dose is 5 cc, followed in one minute by another injection of 5 cc, followed in one minute by a third injection of 5 cc if no response has been obtained.

Ordinarily the injection of epinephrine plus massage of the heart will not stop ventricular fibrillation. However in case 2, reported herewith, massage plus the possible benefit of neosynephrin plus pulmonary ventilation were successful.

In the final analysis the success of cardiac resuscitation will depend on (1) the cause of the cardiac cessation (2) the condition of the heart before cessation occurred and (3) the elapsed time before proper resuscitation measures are attempted. When the cause of the cessation is due to vagal reflexes arising outside the heart the possibility of resuscitation is good with a healthy heart muscle. When myocardial disease existed prior to cessation the possibility of resuscitation is decreased. When the cessation is due to ventricular fibrillation the possibility of resuscitation under ordinary conditions is remote, and this possibility is further decreased by the fact that fibrillation does not usually occur in a previously healthy myocardium. Fortunately the greater number of cardiac failures seen during operations, in warfare, in subasphyxiating gas attacks and in electrical shock are due to standstill rather than fibrillation<sup>15</sup> and it is in this group that the largest number of cases of successful resuscitation will occur.

In cardiac cessation the odds in favor of resuscitation decrease with each minute that passes before proper measures are applied.

The stakes are high—a human life.

The half hearted attempts at resuscitation should be replaced by early and bold attempts at resuscitation in which a definite routine is used. The feeling that once the heart has stopped the patient is gone and nothing will help should be replaced by the knowledge that a human life can and may be saved and any attempt is justifiable.

#### REPORT OF CASES

CASE 1—W P a man aged 59 was admitted to the Flower and Fifth Avenue Hospitals on Sept 10 1941 with a diagnosis of carcinoma of the right lung. The diagnosis was substantiated by biopsy of material obtained by bronchoscopy and he was subjected to a right pneumonectomy on September 16. A preoperative electrocardiogram revealed no abnormal findings.

With the patient under endotracheal ether and oxygen anesthesia a posterior lateral approach was made. The pulmonary artery and veins had been doubly ligated and cut between ligatures. While the peribronchial tissues were being dissected at approximately one and one-half hours after the start of the operation the heart became irregular and ceased to contract. The anesthetist was immediately notified and oxygen (100 per cent) was substituted for the anesthetic. Positive pressure and release pulmonary ventilation was carried out by the anesthetist about twenty times a minute. At the same time manual massage of the heart was started by the operator, who placed his left hand over the right lateral and posterior surface of the mediastinum and compressed the heart up against the posterior

14 Scherf David Personal communication to the authors

surface of the sternum. In one minute the heart was felt to contract, and the massage was discontinued. The heart contractions became stronger and the rhythm was regular. The operation was continued five minutes after the cardiac standstill had occurred. The peribronchial tissues were now infiltrated with 2 per cent procaine hydrochloride close to the carina. The bronchus was ligated and severed ten minutes after the operation was resumed. Immediately on cutting across the bronchus the heart again ceased to beat. Again the anesthetist was notified and 100 per cent oxygen was substituted for the anesthetic, and pulmonary ventilation was instituted by manual compression and release of the anesthetic bag. At the same time manual massage of the heart was again started. After one minute when no heart contraction had occurred, 1 cc of epinephrine (1:1,000) was injected into the right auricular chamber and manual massage of the heart was continued. One minute after the epinephrine was injected the heart was felt to contract, and the massage was discontinued. The beat became stronger and the rhythm regular, and the operation was continued to its successful conclusion, approximately one and one quarter hours later. Twenty minutes after the operation was finished the endotracheal tube was removed and the patient was moved from the operating table to a stretcher. He immediately became cyanotic, and respirations and pulse stopped simultaneously. A bronchoscope inserted after a few minutes allowed a small thick plug of mucus to be aspirated from the remaining bronchus. All additional resuscitative measures failed.

The first cardiac standstill was quite apparently due to a vagal reflex from the plexus surrounding the bronchus. Although procaine hydrochloride infiltration allowed a further dissection of the peribronchial tissues without any cardiac disturbance, yet the reflex again became active causing cardiac standstill when the bronchus was severed. The speculation as to the possibility that atropine given intravenously after the first cardiac standstill may have prevented the second cardiac standstill is worthy of mention.

This case illustrates the quick response of the heart to early massage. The death of the patient may have been due to the fact that the original cause of the cardiac standstill was still active or it may have been due to anoxia from the mucous plug in the bronchus.

*CASE 2—Successful resuscitation following auricular and ventricular fibrillation*

W. B., a Negro aged 57, was readmitted to the Metropolitan Hospital on Sept. 11, 1941 for a carcinoma of the middle third of the esophagus. On July 24 a gastrostomy had been performed under cyclopropane anesthesia without any complication. On August 18 an esophagectomy was performed. Before the operation the heart action was regular and the electrocardiogram showed no abnormality.

Intratracheal cyclopropane anesthesia was used and begun at 2 p. m. At 2:15 p. m. cardiac fibrillation was noted and the anesthetist administered 1 cat unit of digifolin by hypodermic injection. At 2:25 the operation was begun. A posterior lateral approach was made through the seventh left intercostal space. At 2:35 the heart was inspected and found to be definitely fibrillating (auricular) and making irregular and tumultuous contractions. The administration of cyclopropane was discontinued and ether-oxygen was used as the anesthetic. Because of the seriousness of the lesion it was decided to continue the operation. An attempt was made to free the esophagus. All during the operative procedure the heart continued to beat in a most irregular fashion. The beats became weaker, and at 3:45 there was suddenly no longer any expulsive beat of the ventricle although it continued to twitch and fibrillate. The movements of the ventricle were irregular, incoordinated and independent of one another, there was no single wave of movement. Control of respirations had been taken over by the anesthetist at 3:30, or fifteen minutes

before the heart stopped beating, and now oxygen (100 per cent) was substituted. Manual heart massage was immediately started, and ventricular fibrillations could be felt by the operator's hand as well as seen by the operator and several assistants and observers. After three minutes of heart massage with no contraction, 2 cc of neosynephrin and 1 cc of nikethamide were injected intravenously. Within one minute the heart was felt to contract, and massage was discontinued. The contractions became stronger, although the beat was still totally irregular and the auricles continued to fibrillate. The operation was then continued. Because the growth of the esophagus had infiltrated the lung and the descending aorta, operation was finally discontinued and the chest closed in the usual manner. The heart continued to fibrillate and the pulse was irregular until 9 p. m., or five hours after the operation was finished, then the pulse became regular.

The immediate postoperative reaction and recovery were satisfactory in every respect after the pulse became regular. The patient died on the eighteenth postoperative day from pneumonia. The postmortem examination showed a "bronchopneumonia of the left lung and carcinoma of the esophagus with infiltration of the left lung and thoracic aorta." The microscopic diagnosis was "epidermoid carcinoma."

The fibrillation was evidently brought on by the cyclopropane anesthesia, as it was first noticed five minutes after the administration of cyclopropane had been started. A preoperative electrocardiogram showed no abnormal findings, although on two occasions there was a clinical impression that fibrillation was present. The fibrillation was confined at first to the auricle and suddenly spread to the ventricle followed by cessation of any expulsive contraction, although the fibrillating fibers could be seen and felt. Manual cardiac massage had been continued three minutes before the intravenous injection of neosynephrin and nikethamide (no defibrilator was available). Within one minute after the injection, the ventricular fibrillations gave way to actual contractions. It is decidedly questionable whether sufficient time had elapsed for the drugs to be moved on to the heart by artificial systole. It is possible that the resuscitation may have been due entirely to the cardiac massage and pulmonary ventilation. On resuscitation, auricular fibrillation immediately returned and continued for five hours after the operation before the pulse became regular.

It has been assumed from animal experimentation that manual cardiac massage would not resuscitate a fibrillating ventricle. This is the first reported case we have been able to find of successful resuscitation with operative recovery of the patient following cardiac cessation due to auricular and ventricular fibrillation.

*CASE 3—*H. M., a white girl aged 13 years, was admitted to the Metropolitan Hospital on June 12, 1941 with a history of pulmonary abscess and empyema four years previously, at which time a rib resection had been performed. After examination a diagnosis was made of cystic bronchiectasis of the upper and lower lobes of the left lung, atelectasis of the lower lobe and bronchocutaneous fistula. A pneumonectomy was performed on July 31.

Endotracheal cyclopropane anesthesia was administered. One hour and fifteen minutes after the operation was started, the dissection of the hilus was begun and atropine  $\frac{1}{150}$  grain (0.4 mg) was injected at this time. This was followed by 1 per cent procaine hydrochloride injected into the hilar tissues. Because of some irregularity of the heart the anesthetic was changed to ether. For the next thirty minutes the respirations were unsatisfactory and there was some cyanosis of the lips and finger tips. To improve pulmonary ventilation, control of the respirations was instituted by the anesthetist. During the dissection of the hilar tissues there was noticed a twitching

of the right arm and right leg and particularly on manipulation of the mediastinum. These twitchings lasted for twenty-five minutes. The heart action became weaker, and despite the controlled respirations the patient was moderately cyanotic. Two hours and forty minutes after the operation was started and while the mediastinal dissection was still being done the heart ceased to beat. Manual massage of the heart was immediately started and one minute later 1 cc of epinephrine (1:1000) was injected into the right auricle. Massage was continued, and one minute later the ventricle was felt to contract and massage was discontinued. The contractions became stronger, and the heart resumed its normal function. Mediastinal dissection was continued and thirty minutes later, when the bronchus was ligated before being severed ventricular standstill occurred again. Cardiac massage was immediately started and after two minutes 1 cc of epinephrine was injected into the right ventricle. Massage was continued and after three minutes the ventricle was felt to contract and massage was discontinued five minutes after it was started. The heart again resumed its normal activity, and the operation was completed forty-five minutes later (total operative time approximately four hours). This patient never regained spontaneous respirations and it was necessary to continue artificial pulmonary ventilation. Approximately one and one-half hours after the operation was finished the heart stopped beating and the patient died.

This patient had evidenced some difficulty in pulmonary ventilation continuously after the hilus dissection had begun and was continuously cyanotic. The cause of the twitching of the right arm and leg may have been from cerebral anoxia or from an embolism, either air or blood clot. The failure of the respiratory center was probably due to anoxia. The cardiac cessation on both occasions was quite evidently a vagal reflex and this was active in spite of the atropine by hypodermic and the local injection of the procaine hydrochloride. On both occasions, however, the heart responded to massage and epinephrine.

CASE 4—J. B., a Negro aged 56, was admitted to the Metropolitan Hospital on Sept. 18, 1940, with a Janeway gastrostomy which had been performed on June 26 for carcinoma of the middle third of the esophagus. On September 30 an esophagectomy was performed. A left transpleural approach was made. A preoperative electrocardiogram had revealed some myocardial damage.

Intratracheal cyclopropane was the anesthetic. Two hours after the operation was started while the esophagus was being freed from under the arch of the aorta ventricular standstill occurred. Cardiac massage was immediately started and pulmonary ventilation with 100 per cent oxygen was maintained by the anesthetist. After two minutes 15 cc of neosynephrin was given intravenously and cardiac massage was continued. Three minutes later the heart was felt to contract and massage was discontinued. The contractions were weak and no blood pressure could be recorded for at least one hour following. The operation was continued the esophagus was removed with the growth and the operation was successfully concluded one and one-half hours after the ventricular standstill had occurred.

The immediate postoperative condition was fair but on the third day after the operation the patient became seriously ill and died of pulmonary edema.

Three minutes elapsed after the neosynephrin was administered intravenously before ventricular contraction occurred, this was sufficient time for it to be moved on to the myocardium, and it was probably of some benefit.

This case again illustrates the benefit of early and continued cardiac massage plus pulmonary ventilation. The cardiac standstill was due to reflexes from the vagus started by dissection around the arch of the aorta.

## THE MENACE OF "SILENT" OVARIAN CARCINOMA

H. S. CROSSEN, M.D.

ST. LOUIS

By "silent" I mean without symptoms—without any indication to the patient that a serious process is present. Patient after patient is seen with an extensive growth of long duration but with only a short period of local symptoms. The first visit to the physician shows a large growth or ascitic fluid from peritoneal carcinosis. The advancing carcinoma causes only such minor disturbances that the patient hardly notices them. Thinking back, when questioned she recalls that the abdomen has been a little larger for a year or so or that there was bloating or some frequency of urination, but only in the last few weeks was there enough disturbance to make her feel that perhaps an examination was advisable. Some examples from my experience will serve to illustrate the point.

### REPORT OF CASES

Mrs. S., aged 56, had a gradual loss of weight for two years but no local symptoms till a few months before consulting a physician and even then there was only indefinite discomfort in the abdomen and back. Abdominal examination showed a mass in the left side projecting up from the pelvis and the patient was sent for operation. The operation revealed an extensive carcinoma of the ovary which had already invaded irremovable structures. The main tumor was removed and roentgen therapy was given for the extensions. Repeated roentgen treatments prolonged life in fair comfort for a year.

Mrs. M., aged 70, had noticed gradual enlargement of the abdomen for a year and a half with some loss of weight, but there were no localizing symptoms except indefinite discomfort in the lower part of the left side of the abdomen. The first examination revealed a large cystic mass filling the pelvis and extending to the umbilicus. Operation showed an ovarian cyst which was carcinomatous and with deep extensions. The primary growth was removed and roentgen therapy was given for the irremovable portions.

Mrs. H., aged 52, had come under my care at the age of 47 for treatment of a retrodisplaced myomatous uterus with some prolapse and menstrual irregularity and hot flushes. At that time she was put on conservative treatment and directed to return in two months. She did not return for five years because as she stated there was no special disturbance and I felt well right along until some months ago. The principal symptom when the patient came at the age of 52 was enlargement of the abdomen. She thought this had come on gradually but in the last two weeks it had become well defined and was accompanied with discomfort and an occasional pain. Examination showed pronounced ascites with some masses in the pelvis. Operation revealed general abdominal carcinosis of ovarian origin. No structure could be removed except a specimen for microscopic diagnosis.

Mrs. P., aged 47, had noticed enlargement of the abdomen for two months with a feeling of pressure soreness and frequency of urination for six weeks. Examination showed a pelvic mass extending half way to the umbilicus. At operation I found a carcinoma of the right ovary with extension to the uterus and other ovary and tube and also to the adherent appendix and abdominal wall. The main mass was removed along with the uterus, the other ovary and tube, the appendix, and a specimen from the involved abdominal wall. In each of the structures mentioned including the abdominal wall specimen, the extension of carcinoma was confirmed by microscopic examination. Postoperative roentgen therapy was employed.

with unexpectedly good results. The operation was in 1933, and the patient is still well and strong and without evidence of recurrence. The patient was a physician's wife. Her sister had died of ovarian carcinoma and her mother of cancer of the stomach. In spite of these facts favoring close observation, the growth of the ovarian cancer was so "silent" that it had extended into surrounding structures before there was any intimation of its presence.

Miss R, aged 48, was a patient for whom, at the age of 45, I had performed a hysterectomy for myoma with right salpingo-oophorectomy and appendectomy, and recovery was without special incident. Five years later she was sent by her physician for treatment of a pelvic tumor extending almost to the umbilicus. She had noticed some pressure in the abdomen for about a year but gave little thought to it. An increase in the pressure discomfort finally caused her to go to her physician who found the tumor. Operation showed extensive abdominal carcinosis originating in the left ovary. No structure could be removed. Repeated roentgen treatments kept the patient in fair comfort for nearly a year.

The lesson of this case is that I should not have left an ovary at age 43. I thought then that it was advisable, but I know better now.

Mrs. G, aged 55, went to her physician because she had noticed discomfort in the left side of the lower part of the abdomen off and on for a month or two. Examination showed a tumor the size of a fist filling the left side and central portion of the pelvis. Operation revealed a carcinoma of the left ovary. It had already spread to adjacent organs and into irremovable structures. The main mass was removed, and with roentgen therapy the patient lived for a year and eight months.

Mrs. S, aged 55, had noticed some constipation and nausea and frequent urination for several months and a slight bloody discharge for two weeks. She was three years past the menopause. Examination revealed a pelvic tumor extending up to within 1½ inches of the umbilicus. Operation showed extensive abdominal carcinosis, originating in the right ovary and involving adjacent structures so deeply that nothing could be removed except the laboratory specimen. Repeated courses of roentgen treatment produced temporary benefit over a period of two years.

Mrs. M, aged 70, stated that for about a month she had noticed intermittent pain and soreness in the abdomen particularly when lying on either side. There had been constipation for the past year and considerable bloating, but less lately. She had lost 7 pounds (3.2 Kg) in the last two months and also noticed some frequency of urination. Examination showed an irregular mass in the left side and central portion of the pelvis and extending up to the umbilicus. The diagnosis was carcinoma of the left ovary with general abdominal carcinosis. Gastrointestinal x-ray examination showed intestinal involvement. As the surrounding penetration was clearly too extensive for curative operation and there were no obstructive symptoms or severe pain necessitating palliative operation, the patient was given roentgen therapy to check the growth as much as possible. Repeated roentgen treatments kept her fairly comfortable for six months.

Miss L, age unknown, was seen about a year after the menopause. She was a rather peculiar individual, and never did reveal her age. She had been having vague intermittent abdominal discomfort for six months, with a feeling of pressure and some frequency of urination, and it was an increase of these minor discomforts in the last two months which caused her to seek medical advice. Examination showed a pelvic mass extending half way to the umbilicus. The patient was very stout, and deep palpation was unsatisfactory. There was general tenderness in the lower part of the abdomen, where irregular nodules could be felt. Operation revealed general abdominal carcinosis of ovarian origin. Nothing could be removed except the specimen for microscopic diagnosis. Roentgen therapy was advised as a palliative measure, but the patient preferred not

to take it. She continued in fair comfort for a considerable time and died ten months after discovery of the growth.

Mrs. C, aged 46, had noticed gradual enlargement of the abdomen for several months, with bloating, occasional pains, constipation and some frequency of urination but no well defined symptoms. Examination showed the abdomen enlarged by ascitic fluid and a deep pelvic mass adherent in the posterior cul-de-sac. Gastrointestinal x-ray examination eliminated intestinal growth, and gallbladder visualization indicated normal functioning. Operation revealed general abdominal carcinosis originating in an ovary. The involvement was widespread and deep, and no structures could be removed except a specimen for microscopic examination.

Miss B, aged 49, was still menstruating fairly regularly. She stated that she was "perfectly well" up to three weeks preceding her visit, at which time she noticed that the abdomen was enlarged, making the clothing somewhat tight. In these last two or three weeks there were also pains in the abdomen and considerable backache, and she decided to consult a physician. Examination revealed the abdomen distended with ascitic fluid and a large mass extending up from the pelvis. Operation showed the pelvis filled with an ovarian carcinoma, which had extended deeply into the surrounding structures and upward in the abdomen even into the liver. Only a specimen for microscopic examination could be removed. The patient preferred not to take roentgen therapy. She lived nine months after discovery of the growth.

Mrs. P, aged 64, had noticed enlargement of the abdomen over a considerable period without particular discomfort, but for the three weeks preceding her visit there had been an increasing feeling of fullness and pressure, which caused her to consult a physician. The examination revealed a pelvic mass extending to 2 inches above the umbilicus. Operation showed a large ovarian cyst with some solid portions and also a smaller growth in the other ovary. Deep in the pelvis about the cyst there were dense adhesions of doubtful character. I finally succeeded in removing both ovarian tumors along with the tubes and the corpus uteri. Microscopic examination showed the ovarian tumor of each side to be malignant, and postoperative roentgen therapy was given. The operation was in September 1940, and so far the patient is well and without evidence of recurrence, but the outlook is not good.

#### COMMENT

These 12 cases show the symptomless progress to extensive involvement which represents the natural history of ovarian carcinoma. Some patients are fortunate enough to have a coincident disease which takes them to a physician, who in the course of routine pelvic examination discovers the silent growth before it has progressed beyond removal. Most of the favorable cases of ovarian carcinoma are discovered in this way. Occasionally some early complication of the growth causes pain which leads to the examination. With these fortunate persons I am not dealing here. My purpose in this paper is to focus attention on the symptomless onset and symptomless progress of uncomplicated ovarian cancer. It is ordinarily a slow growing tumor, which penetrates into irremovable structures before the appearance of warning symptoms. The cases cited represent the experience of just one physician for a short period of thirteen years, 1929 to 1942. Multiply this by the number of gynecologists of extensive practice and add the numerous operations for late ovarian cancer by other gynecologists and by general surgeons and add also the number of patients who die of "ascites" and "abdominal cancer" without recognition of the ovarian growth, and you get some idea of the magnitude and importance of this "silent" menace.

## WHAT SHALL WE DO ABOUT IT?

At present we are confronted with a form of creeping death which defies early discovery and progresses to incurability despite all efforts carcinoma of the involuting ovary. Much excellent work has been done by gynecologists in investigating the etiology, pathology, diagnosis and treatment of ovarian cancer. But still most patients consult a physician when the growth is past cure and with a history of only recent symptoms. How can this situation be attacked effectively?

Physicians had to deal with a somewhat similar problem of fatal delay in carcinoma of the cervix uteri, and in that connection there were two steps which opened the path to the objective and which are now contributing greatly to the saving of lives. One of these steps is the removal of tissue presenting a condition that makes it specially susceptible to cancer development, that is the removal of chronic cervicitis or other chronic cervix irritation by conization or conical excision before cancer starts, the other step is periodic examination to detect early evidence of cancer or of chronic irritation that may lead to cancer. Of course many improvements have been made also in the treatment of discovered cancer of the cervix but the major part of the great advance in preventing deaths from that disease must be credited to these two steps. Much remains to be done in making these two procedures a part of the working rules of every physician but that process is proceeding apace and each year adds to the widening circle of those who incorporate these life saving measures into their daily practice.

I feel that in seeking to reduce deaths from carcinoma of the ovary one must rely largely on these same two steps, namely removal of tissue which has become specially susceptible to cancer development and periodic examination to detect lesions of which the patient is not aware. To comprehend the situation one must squarely face three grim facts. First, a large proportion of patients with ovarian carcinoma consult physicians too late for cure, second, in some cases the patient in whom one leaves an involuting ovary at abdominal operation dies later of ovarian cancer, and, third, many women who are now active and comfortable and apparently well are carrying cancer of an ovary. A favorable feature is that even with considerable enlargement which could be easily detected on deep vaginoabdominal palpation, the growth may still be limited to removable structures. But women with this condition will wait for examination till they notice symptoms and then die of the disease in spite of all that science can do.

As I see it the greatest contribution the physician can make toward the lessening of these fatalities is the practical application in his daily work of two rules: (1) removal of the involuting ovaries whenever the abdomen is opened at an age and under circumstances which permit such removal, (2) insistence on regular periodic pelvic examination of patients who ask us to assume responsibility in regard to their health.

1 When does ovarian involution begin? The menopause (complete cessation of menstruation) occurs usually between the ages of 44 and 47, with exceptions somewhat below and above these limits. The climacteric (gradual involution of the ovaries) begins two or three years before the menopause and extends some years after it. Though there is considerable individual

variation as to age of onset of ovarian involution, a reasonable rule would be to apply this safety measure in all abdominal operations when the patient has reached the neighborhood of the age of 42. Some physicians would perhaps put this average age later and some would put it earlier. Also special conditions are found, and special desires of the patient are of course to be taken into consideration. What I wish to emphasize is not this or that particular age but the fact that in an abdominal operation in a woman in or near the period of ovarian involution the matter of ovarian removal should be given most careful consideration. The involuting ovaries have fulfilled their reproductive and endocrine functions. They are no longer an important part of the economy but vestigial structures which carry a special tendency toward cancer—and toward a particularly dangerous form of cancer, in that it develops to an incurable stage without warning symptoms.

The realization of the necessity of adopting this safety measure has been obscured and delayed by the various arguments for retention of an ovary. In the first place, there is the excellent surgical rule to do no more operating than necessary—to remove no structure without a definite reason of sufficient importance to justify the additional operative risk and any probable upset in physiology. Again, the great importance of the ovaries during the span of their physiologic activity projects about them a halo which tends to obscure the fact that they are only temporary organs that cease to function after a certain period. Again, there is the desire to lessen the hot flushes and other disturbances of ovarian cessation by preserving ovarian tissue even though it is functioning only partially. Still again there is the natural desire of the patient that an ovary be saved if practicable. These are all valid arguments and have long influenced decisions, but through careful observation and bitter experiences I have come to realize that the danger of cancer development in the involuting ovary outweighs all these arguments for leaving an ovary in an abdominal operation in the age of involution.

Though necessary for reproduction and accessory activities connected with child bearing, the ovaries are not the basic factor in sex determination and sexual response which is so generally assumed. The sex of a person is determined long before the ovaries are formed, sexual response continues long after ovarian function has ceased, and, as I have clearly shown in case reports,<sup>1</sup> normal female desires and instincts and outlook on life and sexual response may exist without ovaries, with testicles instead of ovaries, and without either. As noted in reporting one of my cases, "It may be stated that in this case and in the several cases reported the absence of ovaries and the presence of testicles seemed to exert little or no influence on the strong female desires and responses. Despite the hindering presence of testes and later the lack of sex glands altogether, the patient's feminine personality continued the even tenor of its way."

2 At what period is periodic pelvic examination required in connection with cancer of the ovary? That is a question to which I have given considerable study, in the endeavor to minimize trouble and expense to the patient and yet maintain a fair security against undis-

<sup>1</sup> Crossen H S. A Problem in Sex Classification. *Am J Obst & Gynec* 35:123, 1939.

covered ovarian cancer. In considering periodic examinations in connection with the subject of cancer of the cervix we<sup>2</sup> stated the following in our textbook:

It is important to work out a practicable plan. The local examination should be made often enough to reasonably exclude irritation that would favor cancer development, and yet no more often than is necessary for safety. The choice of interval should be such as to appear reasonable to most patients when the matter is explained to them. The choice of a rather long interval which appears to the patient so reasonable that she returns regularly will go much further toward preventing cancer than the choice of an interval so short that the patient neglects returning and finally gives up regular examination. Considering the various angles of the matter, it seems to us that a reexamination once a year from age 35 to 55 is a reasonable rule to incorporate in our advice to these patients in connection with uterine cancer.

The probability of the patient's cooperation in the idea of a regular yearly examination may be enhanced by pointing out that this twenty year period is one of change in body structure and function and also that many authorities are recommending a general examination yearly as a safety measure to determine how the various vital organs are standing the wear and tear of life's activities. This explanation reinforces and emphasizes the idea of regular general examinations, of which the local examination is a part.

The special period for ovarian cancer begins somewhat later, extending from the ages of 40 to 60. Also more frequent examinations are required. Cancer of the cervix is usually preceded by a period of chronic cervicitis, which can be seen on examination. This gives ordinarily a leeway of many months of appreciable lesion before actual cancer development. But with cancer of the ovary there is no such preceding warning. The cancerous infiltration and enlargement of the ovary is the first appreciable lesion and requires prompt operation to save the patient. Hence in the period from 40 to 60 years of age pelvic examination is advisable every six months instead of once yearly, as may suffice before and after that period.

Of course, a practicable rule of action must take into consideration the patient's natural reluctance to examination not definitely indicated by troublesome symptoms. Here is where the leadership of the physician comes in. By tactful instruction that causes no undue apprehension but rather a comfortable feeling of added safety, the patient may be made to see the advisability of local examination as part of the general examination on which responsible advice to her must be based. There are few patients who do not appreciate the relief from anxiety afforded by a careful examination or who will not see the health advantage and eventual economy of regular examinations which would detect disease in a curable stage instead of waiting for symptoms which signal incurability. However, experience has shown that the most serious defect in the machinery of preventive medicine lies just at this point. Patients do not return for the necessary examinations. Why? Until this question is answered and the import of the answer is recognized and applied in a practical way, little headway will be made in preventing deaths from ovarian cancer or other obscure diseases. Hence it is advisable to warn the physician of this pitfall in the seemingly clear path.

#### CAUSE OF FAILURE

The splendid educational campaigns conducted by the American Society for the Control of Cancer and other interested agencies have gone far toward preparing the public for the advice which the individual physician could give to his patients in regard to regular examinations, including pelvic examinations. Such examinations at regular intervals are necessary for the discovery of uncomplicated ovarian carcinoma in a curable stage as well as of other hidden lesions. Do we explain to our patients the advisability of returning at certain intervals for this examination, putting the advice in a practical way so that they understand it and can profit thereby? The answer in general must be that we do not do so. The reasons for not doing so are many and varied, and, though each is insignificant compared to unrecognized cancer development, in the aggregate they have sufficed to prevent the physician from taking up this matter with each patient in the practical and effective way with which he takes up her other health problems.

The responsibility of the individual physician to his patients for persistent educational efforts in this direction is very great, and that responsibility must be recognized and met. Measuring up to this responsibility will require a severe wrench from the ordinary and established custom of treating only evident lesions and waiting for ovarian cancer to develop to the evident stage before giving consideration to the matter. Radical advances usually require radical departure from established custom and from easy following of the beaten path. The great medical triumphs over apparently insurmountable difficulties were not attained by the complacent and satisfied but by those who were ready to make courageous struggle against the apathy of easy popular custom and the deadening inertia which operates against radical advance.

The excellent general educational campaigns referred to have done a great deal to cause women to come for the first examination, but what has been done to educate the examined patient to return at proper intervals for the reexaminations which are so necessary? There is a tendency to blame the patient when she comes with a cancer that is past cure. But one cannot expect the patient to know the necessity of returning when she is without symptoms unless she is told to do so. She has not taken a course in medicine. She is depending on her physician to give her the medical information necessary to guard her health in this respect. The influences of the general educational agencies referred to are most helpful as far as they go, but the return of our patients for the regular pelvic examinations which we know are needed depends largely on what we say to them in the course of our medical advice.

In the last analysis, it rests with the physician to educate his patients to an appreciation of the fact that certain growths may develop in the pelvis without warning symptoms and hence that regular periodic examinations are necessary and urgent as a safety measure. The particular form of advice as to return will of course vary with different physicians and with different patients. With some patients the simple advice to return at a certain time will be followed, while others may wish to be told the reasons, urgency, and so on, before deciding the matter. The important thing is to take the time and thought required to put the advice to each patient who should return in such a way that she will benefit from it, and not simply as some general remark to act as a salve to conscience should she return years afterward with an incurable ovarian carcinoma.

<sup>2</sup> Crossen, H. S., and Crossen, R. J. *Diseases of Women*, ed. 9, St. Louis, C. V. Mosby Company, 1941, p. 557.

Another item in this immediate connection should be mentioned. Patients with the best of intentions of returning as advised may fail through oversight at the time because of the press of other activities. An effective aid at this point is the prearranged notification, used so generally in business and already to some extent in medical and dental work. When the advice to return at a certain time is given, a card for the patient is placed under that month in the file, and at the appointed time a brief reminder note is sent. Patients are notified regularly on financial matters, and it is certainly in order and would be an important step in advance to notify them regularly on this medical matter which is a life saving measure.

In connection with these pelvic examinations there arise of course many questions of differential diagnosis and difficult decisions as to whether or not there is evidence of ovarian carcinoma or other lesion requiring operation. Those items do not come within the scope of this paper, but there is one associated point to which attention should be called. When one is doing a vaginal operation, such as curettage, conization, radium treatment or plastic work, it is very important to make careful examination of the ovarian regions, so that any associated lesion there may be discovered. Such examination under anesthesia or analgesia is of course particularly important in stout patients in whom deep palpation otherwise may be so difficult that a small mass may escape detection. Also the recording in the operative note of the exact conditions in the pelvis at this deep examination will prove exceedingly helpful in determining the significance of conditions found later.

#### SUMMARY

Symptomless onset and symptomless progress to incurability constitute the natural history of ovarian carcinoma. Earlier discovery is due to some incidental associated condition or to a pelvic check-up examination.

The aggregate of deaths from this cause is large, much larger than is generally appreciated. To the known cases must be added the unrecognized ones with death certificate designations of "ascites" and "abdominal cancer." A large proportion of the cases of general abdominal carcinosis originate in an ovary.

The silent character of the onset and progress of ovarian cancer seals the doom of patients with this condition unless measures that are really effective against the serious difficulties of the situation are put into practice. The following three steps are advisable and urgent in reducing deaths from this insidious disease:

1. Removal of the involuting ovaries whenever the abdomen is opened under circumstances which permit of such removal.

2. Insistence on regular periodic pelvic examination of patients who ask the physician to assume responsibility in regard to their health. These periodic examinations for silent ovarian carcinoma should be made every six months, instead of once yearly, which was formerly supposed to provide adequate safety. One must give the time and thought necessary to make this advice of real benefit to each patient instead of simply throwing out some general remark to act as a salve to conscience should the patient return later with incurable cancer.

3. Utilization of every opportunity afforded by anesthesia for a minor vaginal operation to make deep accurate palpation of the ovarian areas, the findings to be recorded in the operative note for future reference and comparison.

## SULFAGUANIDINE IN TREATMENT OF DYSENTERY (BACTERIUM FLEXNERI) CARRIERS

LINCOLN OPFER, M.D.

AND

VIRGINIA HALE, M.D.

NORWICH, CONN.

Attempts with sulfaguanidine in the treatment of bacillary dysentery were destined to follow the more or less successful trials with the previously discovered sulfonamide compounds, namely, sulfanilamide,<sup>1</sup> sulfapyridine and sulfathiazole,<sup>2</sup> and also the highly encouraging experimental studies of Marshall and his associates.<sup>3</sup> These workers noted that sulfaguanidine combined the advantages of free solubility in water together with poor absorption from the gastrointestinal tract. Further clinical investigation has confirmed the tendency of the usually administered dosages to saturate the intestinal content without exceeding a relatively low level of concentration in the blood.

In a well controlled clinical study, Lyon<sup>4</sup> described the remarkably rapid improvement which followed the administration of sulfaguanidine in 17 of 23 cases of acute bacillary dysentery of the Flexner type. The ability of the drug to destroy permanently the organism in the intestinal tract was not evaluated in this study, probably because the treated patients were inhabitants of a number of communities in the tristate area of West Virginia, Ohio and Kentucky, where the disease is endemic and reinfection is presumably common.

The report of Rantz and Kirby<sup>5</sup> on the use of sulfaguanidine in the treatment of dysentery carriers stresses particularly the necessity for evaluating any treatment of this infection as much for its ability to eliminate completely the organism from the stool as for its ability to relieve clinical symptoms. In 9 of 11 cases, dysentery bacilli (*Bacterium flexneri*) disappeared from the stools during treatment and did not return over periods varying from thirty to ninety days.

A particularly good opportunity for gaging the efficacy of sulfaguanidine from both these points of view and with the added advantage of comparison with a large, untreated group of controls from a previous outbreak presented itself at the Norwich State Hospital.

#### FIRST OUTBREAK (1939-1940)

During an outbreak of acute bacillary dysentery (*B. flexneri*, variety strong), which occurred in the fall and winter of 1939-1940, the organism was isolated at least once from the stools of 38 patients. Eighteen of the patients were considered to have the disease, since they presented as well the symptoms of bloody diarrhea, elevated temperature and frequently nausea or vomiting. The remaining 20 were classified as carriers from the onset. The patients were all women, for the most part.

of very advanced age. The outbreak was of the contact type and confined to a single building, the women's infirmary.

Since this outbreak occurred before the era of chemiotherapeutic management of bacillary dysentery, the only treatment which the patients received was supportive,

TABLE 1—Statistical Data on the First Outbreak (Patients Untreated)

| Patient | Positive Stool Cultures |        |      | Total Number of Stools Cultured |
|---------|-------------------------|--------|------|---------------------------------|
|         | Age                     | Number | Days |                                 |

\* Patient with dysentery  
† Healthy carrier

with a particular effort made to combat dehydration. Both patients and carriers were quarantined. Release followed a succession of six negative cultures of the stool obtained at least twenty-four hours apart.

It may be seen from table 1 that the stools of 9 patients became negative for *B. flexneri* in less than ten days. In 7 patients from ten to thirty days were required for a final reversal of the stools to negative. Twenty-two of the group of 38 patients, representing over 57 per cent, retained the bacillus in the gastrointestinal tract for one month or longer.

SECOND OUTBREAK (1941-1942)

After an interval of two years, a second outbreak of acute bacillary dysentery, again of the contact type, started in the same building and spread to neighboring dormitories, involving a few occupants of these buildings. None of the patients of the previous epidemic came down with the infection or acquired the organism anew.

Of the 33 patients treated with sulfaguanidine, 15 were classified as having the disease and 18 as symptomless carriers (table 2). All patients but 1 were elderly. From their stools *Shigella paradysenteriae*, variety strong, was recovered, the same organism involved in the previous episode. The only male inmate of the group (patient 27) showed the army variety of *B. flexneri* in his stool.

With few exceptions (patients 1, 2, 3, 4, 14 and 27) administration of the drug was started within four days following receipt of the first positive stool specimen by the laboratory. The same course of treatment was followed in every instance, whether or not the patient was classified as having the disease or as a carrier. Four Gm. daily of sulfaguanidine by mouth was administered in divided doses for one week. No ill effects were observed, and in no case was it necessary to stop use of the drug prematurely.

In all patients the stool collected at the end of the period of treatment was negative for *B. flexneri*. In 6 patients (1, 14, 17, 21, 23 and 30) the bacillus disappeared from the stool before the prescribed total of 28 Gm. of the drug had been given. Since it was frequently impossible to obtain stool specimens at will during the course of treatment, this group was no doubt actually more numerous.

In all but 4 instances (patients 3, 11, 14 and 22) from ten to thirty-eight consecutive stool cultures remained negative over an average period of one hundred and five days. The 4 exceptions were subjected to a second course of 28 Gm. of sulfaguanidine and

\* Patient with dysentery  
† Healthy carrier  
‡ Stools became negative for *B. flexneri* during treatment  
§ Stools intermittently positive for *Eberthella typhosa*

responded promptly with a consecutive series of twelve to fourteen negative stools.

During the routine of culturing for *Shigella*, the stools of 5 patients (24, 26, 28, 30 and 32) of the group intermittently revealed colonies on bismuth sulfite agar which agglutinated as *Eberthella typhosa*. This high incidence of typhoid carriers within a group of

dysentery convalescents may have been partially due to the fact that the carriers of the two organisms were isolated within the same building. The stools of 2 patients (24 and 28), who were also recognized as typhoid carriers prior to the administration of sulfaguanidine continued positive for *Elberthella*. The drug failed to affect this organism although the disappearance of the dysentery bacillus from the intestinal tract was prompt and apparently permanent. We have not yet attempted a deliberate trial with sulfaguanidine in an effort to reduce the number of typhoid carriers.

## COMMENT

The severity of dysentery due to the *Flexner* group of bacilli varies widely. The disease in the outbreaks described in the present study did not represent the acute fulminating type. It was relatively mild and as pointed out by Hodge<sup>7</sup> of the type which is important owing chiefly to its tendency to persist if untreated and to its infectivity.

The advantages of a measure which will reduce the period of the carrier state or eliminate it entirely are obvious in any community. In a large hospital for mental illness where patients, through their untidiness and lack of cooperation may become particularly dangerous carriers, the period of isolation may be shortened for the patient and the duration of the quarantine which is imposed on the entire dormitory or institution may be reduced considerably.

As seen in table 1 57 per cent of the group of patients which did not receive sulfaguanidine continued to carry the bacillus in their stools a month or more after it was first detected. Of this number, 31 per cent were persistent carriers, i. e. those who harbored the bacilli for more than three months after the beginning of the disease. In sharp contrast to this a single course of sulfaguanidine effected the complete disappearance of dysentery bacilli from the stools of 88 per cent of the patients involved in the second outbreak. This result was obtained uniformly during or at the end of treatment with moderate nontoxic amounts of the drug and persisted for an average of one hundred and five days.

Since it is well known that the presence of *B. flexneri* in carriers has a tendency to be intermittent the bacillus being excreted for one or two days in succession and then not again for weeks or more, the usual criteria of a few successive negative stools following the termination of the acute illness cannot be accepted as a guaranty against the reappearance of the organism.

Despite the administration of sulfaguanidine, 4 of 33 patients or 12 per cent, underwent a recrudescence of their infectivity. Although this number is relatively small it indicates that, even with the use of this drug caution must be exercised in deciding when the carrier state is definitely over.

## SUMMARY AND CONCLUSIONS

Two outbreaks of bacillary dysentery caused by the same organism (*B. flexneri*, variety strong) and involving comparable groups of patients occurred in 1939-1940 and in 1941-1942 respectively at the Norwich State Hospital.

The 38 patients with positive stools of the first outbreak did not receive chemotherapy. Fifty-seven per cent of this group maintained their infectivity for a month or longer.

<sup>7</sup> Hodge E. H. V. Modern Views on the Dysenteries and Their Treatment. Practitioner 116: 365 (June) 1941.

The stools of 88 per cent of the 33 patients involved in the second outbreak remained negative for the dysentery bacillus over an average period of one hundred and five days following administration of 28 Gm of sulfaguanidine.

The reappearance of *B. flexneri* in the stools of 4 patients after a first course of treatment indicates the necessity for continued laboratory examinations for several weeks after an apparent reversal to negative.

## STAPHYLOCOCCIC INFECTION SIMULATING SCARLET FEVER

HENRY IRANOW JR., M.D.

AND

W. BARRY WOOD JR., M.D.

BALTIMORE

Scarlet fever was identified by both Sennert and Sydenham as a separate clinical entity during the seventeenth century, but discussions of its etiology remained purely speculative until two centuries later. In 1869 Hallier<sup>1</sup> isolated streptococci from the blood of several patients with scarlet fever, and in the eighties W. H. Power<sup>2</sup> and Klein<sup>3</sup> traced epidemics of the disease to milk obtained from cows with streptococcal mastitis. It is of considerable historical interest that the modern concept of the pathogenesis of scarlet fever was formulated as early as 1893. Thirty years before the classic experiments of the Dicks<sup>4</sup> and Dochez,<sup>5</sup> Berge<sup>6</sup> had written:

Scarlet fever is a local infection, the infectious agent which produces it is the streptococcus in one of its virulent forms in the common type of scarlet fever which one might call pharyngeal the streptococcus multiplies in the pharyngeal and tonsillar crypts and apparently secretes an 'erythrogenic' toxin whose diffusion throughout the organism produces the eruption of the skin and mucous membranes. In puerperal and surgical scarlet fever the local infection is either in the uterus or in the wound. As for the immunity conferred by scarlet fever, it exists only for the cutaneous manifestations.

The evidence which Berge was able to adduce for his theory did not prove to be convincing, and the toxin concept was not generally accepted until the contributions of numerous investigators<sup>7</sup> finally cul-

minated in the convincing experiments of the Dicks and Dochez in 1923.

Scarlet fever was for several years considered to be due to a soluble toxin secreted by a specific strain of hemolytic streptococcus, often referred to as *Streptococcus scarlatinae*. Workers both in this country<sup>8</sup> and in England,<sup>9</sup> however, showed that toxin production was not a property limited to any single type or strain of hemolytic streptococcus; they advanced conclusive evidence that "the production of an erythrogenic toxin capable of eliciting an erythematous skin reaction in man is a property of hemolytic streptococci of human origin in general."<sup>10</sup>

That the erythrogenic toxin of the hemolytic streptococcus represented a single antigenic unit was never questioned until the usage of the Dick test became widespread and reports of occasional anomalies and apparent inaccuracies in the test appeared in the literature.<sup>11</sup> It was then that Park and Spiegel<sup>12</sup> suggested, on the basis of careful titration experiments, that there might be more than one toxin associated with scarlet fever. Trask and Blake<sup>13</sup> in 1933 described cases of scarlet fever apparently due to toxins which were not neutralized by standard Dick antitoxin, and Hooker and Follensby<sup>14</sup> isolated from patients with scarlet fever two strains of hemolytic streptococcus producing toxins which were antigenically different. Reviewing the subject of streptococcus toxins in 1936, Hooker<sup>15</sup> predicted that still other toxins capable of producing scarlet fever would eventually be isolated and identified.

Although scarlet fever is now known to be caused by more than one toxin produced by many different types and strains of beta hemolytic streptococcus, little attention has been paid to the possibility that the disease may be due to toxins produced by organisms other than the hemolytic streptococcus. Our purpose in the present paper is to report a case together with immunologic experiments which suggest that scarlet fever may occasionally be caused by staphylococcus toxin. Attention is also drawn to the literature which has accumulated in support of this concept.

#### REPORT OF CASE

M. W., a 15 year old white schoolgirl, American born, was admitted to the Osler Clinic of the Johns Hopkins Hospital on the evening of July 3, 1941 complaining of pain in the left thigh of four days' duration and of fever for three days.

The family history revealed no familial disease, no other member of the family had suffered from a recent infection or had had any known contact with contagious disease in the recent past.

The past history and system review revealed only a transient psoriasis at the age of 7 months, measles at 3 years and chicken-pox at 4 years. A tonsillectomy had been performed when the patient was 12. Colds were of moderate frequency and were only occasionally accompanied by sore throat. Menarche occurred six months before admission, and menses were regular. Diphtheria, scarlet fever and acute rheumatic fever were specifically denied.

The patient had been in the best of health until two weeks before admission. At that time she contracted a mild infection of the upper respiratory tract, accompanied by a very slight sore throat; there was no fever, the patient continued to attend school, and with no therapy other than a rare gargle with saline solution she apparently recovered completely in ten days.

Four days before admission, while watering the garden, she noticed an aching pain in her left thigh. She knew of no trauma, recent or remote, to account for this pain. It was accentuated by flexion of the hip. The discomfort, at first mild, increased to the extent that she was unable to sleep and cried aloud.

The pain persisted on the following day, and she was unable to eat her meals. Her physician found her temperature to be elevated and prescribed rest, use of a local liniment and salicylates by mouth. This therapy resulted in some regression of her symptoms for several days, but on the day preceding admission the pain in her leg increased strikingly in intensity, and she had a severe shaking chill and experienced nausea and vomiting. When the passage of another twenty-four hours revealed no amelioration of her condition, hospitalization was advised. At no time in the course of this illness did the patient notice any sore throat, nor did there appear any evidence of a respiratory infection.

Physical examination on admission showed that the patient was well developed and well nourished and mildly disoriented. Obviously she was acutely ill. Her temperature was 105 F, pulse 120, respiratory rate 30 and blood pressure 90 systolic and 40 diastolic.

The most striking feature on inspection was a diffuse erythematous rash, which at first was most evident on the trunk and shoulders but which later advanced peripherally. The rash consisted of erythematous macules, which blanched readily on pressure and were most profuse in the folds of the axilla, groins and antecubital fossae. There was no rash on the face, but the latter was diffusely flushed and there was well defined circumoral pallor. On the soft palate and extending onto the hard palate there was an intensely red, fine enanthem. The tongue was dark red, and on its surface hypertrophic papillae stood out producing the classic "raspberry" appearance.

The pupils were round, regular and equal and reacted to light and in accommodation. The fundi were normal. There was some congestion of the conjunctivas. The nares were clear, and there was no evidence of infection in the pharynx. The neck was supple, and the lungs were clear. There was slight but definite, nontender enlargement of the superficial lymph nodes. The heart was not enlarged. The pulse was rapid and regular, and there was a blowing systolic murmur over the base of the heart. The second pulmonary sound was louder than the second aortic sound. Pulses were soft, bounding and equal. The abdominal examination was normal save for slight distention. Inspection of the genitalia showed no discharge or other abnormality. Reflexes were normal. No petechiae or furuncles were present.

There was diffuse tenderness over the lateral aspect of the left thigh and pain on flexion of the thigh. No local swelling could be discerned, and both legs were of equal size. There was no tenderness along the courses of the great veins, nor was there any venous engorgement.

The laboratory findings on admission were as follows. The red blood cell count was 4.99 million, the hemoglobin 12.5 Gm.

per hundred cubic centimeters, and the hematocrit reading 41 per cent. The white blood cell count was 13,100 with 78 per cent polymorphonuclear leukocytes. The corrected sedimentation rate was 31 mm in one hour. Examination of the urine revealed a specific gravity of 1.015, no sugar, a 2 plus reaction for albumin and strongly positive reactions for acetone and diacetic acid. The centrifuged urinary sediment contained 5 to 8 white blood cells per high power field and an occasional red blood cell and hyaline cast. The serologic reaction for syphilis was negative.

On the patient's admission a diagnosis of scarlet fever was made by the intern. Isolation precautions were instituted and the case was reported to the city board of health. All who saw the patient made the same diagnosis. Material from the throat and blood were taken for culture and parenteral fluids administered.

During the night the patient's temperature fell to 103.2 F and on the following morning she was well oriented and said she did not have a sore throat but continued to complain of pain in the left thigh. The rash covered her entire body save for the circumoral pallor and the diffusely flushed face. The throat culture taken the preceding evening showed no beta hemolytic streptococci and preliminary inspection of the blood culture revealed many gram positive cocci. Surgical consultants found no localizing signs to account for the pain in her leg. In the absence of pharyngeal infection in a well defined case of scarlet fever with bacteremia it was concluded that the patient was suffering from nonpharyngeal scarlet fever and that chemotherapy was urgently indicated. Accordingly sodium sulfadiazine was given intravenously and then orally so that on the following morning a blood level of 138 mg per hundred cubic centimeters was attained. The same evening the patient's temperature rose to 107.6 F following a chill. After a test of serum sensitivity 18,000 units of Lederle's scarlet fever antitoxin was administered intramuscularly. The temperature fell precipitously to 98 F and a simultaneous fall in blood pressure was arrested by an infusion followed by a transfusion of citrated whole blood.

A final report on the first blood culture revealed the gram positive cocci to be hemolytic *Staphylococcus aureus*.

On the next morning the second blood culture showed 54 colonies of hemolytic *Staph aureus* per cubic centimeter. The hemolytic streptococcus was never isolated from repeated cultures of the throat, vagina, urine or blood.

Within the twelve hours following the administration of the scarlatinal antiserum there was a striking fading of the rash and the patient's tongue began to show desquamation. Her temperature however slowly rose again to 103 F. Although a presumptive diagnosis of acute osteomyelitis with septicemia was made, it was not until July 6 her fourth hospital day that evidence of definite localization of the infection became manifest. Repeated search both at this time and subsequently failed to show either petechiae or furuncles although her blood culture remained persistently positive for hemolytic *Staph aureus*. The microscopic hematuria disappeared immediately after admission as did the ketonuria.

On the morning of the fourth hospital day well localized pain and tenderness developed over the lateral aspect of the left greater trochanter. With the patient under gas oxygen and ether anesthesia an incision was made over the trochanter and deepened to the bone itself without any pus being encountered. When the cortex of the bone was drilled pus under pressure welled out through the drill holes. Cultures of this pus showed a hemolytic *Staph aureus* identical with that isolated from the blood stream. Adequate drainage was established and the wound was packed open. Intensive chemotherapy was continued, a high blood level of sulfadiazine was maintained and parenteral fluids and another transfusion of citrated whole blood were given.

After operation the patient's course was one of continued improvement, although her temperature remained significantly elevated for almost a week and her blood culture did not become permanently negative until the eighth postoperative

day.<sup>16</sup> Her wound drainage, at first profuse, steadily diminished, and the wound was completely healed over by September 27. Because of the danger of the development of other foci, chemotherapy was continued for a total of three and one-half weeks, no other focus developed, and the only lesion shown by roentgen rays was a localized area of bone destruction in the upper end of the left femoral shaft.

On her fourteenth hospital day desquamation of the palms, soles, fingers and toes began and continued for more than a week. This desquamation was identical with that normally associated with scarlet fever.

Three and one-half weeks after admission, in spite of the fact that daily examinations of the urine had revealed no blood or albumin the patient suddenly voided grossly bloody urine, which showed a 2 plus reaction for albumin. There was, however, no edema and no rise in blood pressure. Although it was thought that the hematuria was probably due to sulfadiazine the possibility of a postscarlatinal acute glomerulonephritis was considered. The results of chemical examination of the blood, an electrocardiogram, venous pressure and a roentgenogram of the chest were normal, and the discontinuance of chemotherapy followed by the forcing of fluids resulted in the voiding of completely normal urine within four days. Shortly thereafter the hip was slowly mobilized and the patient was allowed to return home.

Antistreptolysin titer determined shortly before the patient's discharge was 500.<sup>17</sup>

#### EXPERIMENTAL

When repeated and careful search in this case failed to reveal any evidence of the presence of the beta hemolytic streptococcus, the properties of the organism repeatedly isolated from the patient's blood stream, and also from her left femur at operation, were investigated. The infectious agent was identified as a typical strain of hemolytic *Staphylococcus aureus* and was found to be coagulase positive and to ferment mannite.

In order to determine whether this strain of staphylococcus produced an erythrogenic toxin, a sterile filtrate was prepared using the methods described for the preparation of Dick toxin.<sup>18</sup> After the filtrate had been transferred aseptically to sterile vials, its sterility was confirmed by culture, and the vials were placed in the icebox for several months. The erythrogenic power of the filtrate was estimated by injecting intracutaneously 0.1 cc of various dilutions made with sterile isotonic solution of sodium chloride. The injections were performed on Dick positive volunteers. The erythrogenic power of the filtrate was such that 0.1 cc of a 1:100 dilution produced an intense erythema of at least 10 mm in smallest diameter when the area was examined after twenty and twenty-four hours. Save for the fact that it was much more intense, the erythematous reaction was very similar to the Dick reactions in the various subjects.

The possible antigenic relationship of the staphylococcus and Dick toxins was investigated by attempting to demonstrate the neutralization of the erythrogenic action of staphylococcus filtrate by streptococcus antitoxin. For neutralization experiments Dick positive children were selected who were not at the time of the tests suffering from any known infection. Each neutralization test consisted of six simultaneous intracutaneous injections three into the volar surface of

16. All specimens of blood for culture taken after the institution of chemotherapy were inoculated on mediums enriched with para-aminobenzoic acid.

17. This determination was made for us by Dr. Alvin F. Coburn of the Columbia University College of Physicians and Surgeons, New York.

18. Dick, G. F. and Dick, Gladys H. *Scarlet Fever*. Chicago: Year Book Publishers, Inc. 1938, p. 66.

each forearm. Each injection was separated from its neighbor by at least 6 cm., and the reaction was examined under bright daylight eighteen and twenty-four hours after injection. The injections were made as follows:

A. Into the right forearm: (1) 0.1 cc. of a 1:100 dilution of the staphylococcus filtrate incubated for one hour at 37 C. immediately before injection, (2) 0.1 cc. of a 1:10 dilution of the staphylococcus filtrate incubated just prior to injection with nine parts of scarlet fever antitoxin<sup>19</sup> for one hour at 37 C., (3) 0.1 cc. of a 1:100 dilution of staphylococcus filtrate heated for one hour at 61 C. to test the heat stability of the toxin.

B. Into the left forearm: (1) 0.1 cc. of Dick toxin<sup>20</sup> incubated for one hour at 37 C. immediately before injection, (2) 0.2 cc. of a mixture of equal parts of Dick toxin and scarlet fever antitoxin incubated together for one hour at 37 C., (3) 0.1 cc. of scarlet fever antitoxin.

In order to carry out satisfactory tests with the staphylococcus toxin, it was necessary to select subjects in whom (1) the Dick reaction remained positive, (2) the erythema of the Dick test was prevented by the previous admixture of the Dick toxin with scarlatinal antiserum and (3) the scarlatinal antiserum itself failed to cause a cutaneous reaction. Ten persons were tested, and 3 suitable subjects were selected in whom the following results were obtained with the staphylococcus filtrate:

1. An intense erythema more than 10 mm. in its least diameter, surrounded by a faint erythematous halo, which blanched readily, resulted from the injection of 0.1 cc. of the 1:100 dilution of the staphylococcus filtrate.

2. In each case there was definite inhibition of the erythema produced by the filtrate when it was incubated with the scarlatinal antiserum before injection. In 1 case neutralization was complete, in the other 2 a faint, blotchy, poorly demarcated erythema could just be discerned.

3. Preheating of the staphylococcus filtrate for one hour at 61 C. completely inactivated the erythrogenic toxin.

#### COMMENT

The strain of *Staphylococcus aureus* which caused the bacteremia and osteomyelitis in the present case has been shown to produce a soluble erythrogenic toxin, the effect of which on the human skin was neutralized by scarlatinal antitoxin. Since, in spite of exhaustive and repeated search, no beta hemolytic streptococci were ever recovered from the patient, it is suggested that the scarlatiniform rash was due to erythrogenic toxin produced by the staphylococcus.<sup>21</sup> Although staphylococcic infection simulating scarlet fever is not common, a review of the literature indicates that there is considerable evidence which points to its being a definite clinical entity.

The study of the staphylococcus toxins by methods analogous to those used in studying the erythrogenic toxin of the hemolytic streptococcus has been reasonably extensive. In 1900 von Lingelsheim<sup>22</sup> described a soluble dermatotoxin produced by the staphylococcus, and his observations were soon confirmed by Neisser and

Wechsberg<sup>23</sup> and Parker.<sup>24</sup> Pilot and Afremow<sup>25</sup> in 1927, using techniques described by the Dicks, obtained a toxic filtrate with which they performed cutaneous tests on human subjects. Intradermal injections of then diluted filtrate produced an erythematous reaction analogous to the Dick test; this reaction was prevented by previous admixture of the filtrate with homologous antitoxin prepared in rabbits. Reme<sup>26</sup> tested fifteen strains of hemolytic *Staphylococcus aureus* and found that twelve of them elaborated an erythrogenic toxin.

In 1927 Stevens<sup>27</sup> reported 3 cases of clinically "typical" scarlet fever in which the hemolytic staphylococcus was the only pathogenic organism isolated. One of the patients had an acute osteomyelitis of the thigh. Filtrates were prepared for injection into the skin of rabbits and neutralization tests were carried out with scarlatinal antisera. It is of interest to note the author's remark that "Three antiscarlatinal serums were tested before one was found which did not contain appreciable amounts of staphylococcus antitoxin." Since the commercial scarlatinal antisera of that time were prepared with hemolytic streptococcus filtrates, it is probable that neutralization occurred, similar to that previously described. In the same year Satake<sup>28</sup> isolated a strain of hemolytic *Staphylococcus aureus* from the pharynx of a patient with scarlet fever from whom he had been unable to culture the hemolytic streptococcus. The staphylococcus produced an erythrogenic toxin, and when large doses of the staphylococcus filtrate were administered to patients whose skin reacted to the toxin, a generalized reaction was produced which consisted of prompt fever, malaise, typical scarlatiniform rash, tongue changes, leukocytosis and later desquamation. "It was clear from the results of these experiments," wrote Satake, "that certain strains of staphylococci should cause symptoms very like those of genuine scarlet fever." Clinical reports by numerous later observers<sup>29</sup> have tended to confirm this conclusion.

In 1937 Mundt<sup>30</sup> prepared sterile filtrates from cultures of nineteen strains of hemolytic *Staphylococcus aureus* isolated from a variety of sources. She performed cutaneous tests with the filtrates on a group of Dick positive subjects, each patient receiving six intracutaneous injections, three in each forearm. In one arm the injections consisted of the usual dose of Dick toxin, the same dose of Dick toxin mixed with an equal amount of scarlatinal antitoxin and the Dick toxin mixed with diphtheria antitoxin. In the other arm a similar set of three injections was made with a dilution of the staphylococcus filtrate in place of the Dick toxin. For a "neutralization" to be recorded, it was required

20. Scarlet fever streptococcus toxin for the Dick test. Mulford.

21. The elevated titer of antistreptolysins in the patient's serum does not militate against this diagnosis, since the antibodies may represent a response to an earlier unrelated streptococcal infection or may even be accounted for by similarities in the antigenic structure of the hemolysins of the erythrogenic staphylococcus and the usual strains of hemolytic streptococcus. This latter possibility is to be investigated further.

22. von Lingelsheim, W., cited by Neisser, M. *Handbuch der pathogenen Mikroorganismen*, ed. 3, Jena, Fischer, 1928, vol. 4, part 1, page 457.

that the following conditions obtain (1) that there be a definite erythema of more than 0.5 cm. in diameter caused by the staphylococcus and Dick toxins (2) that the erythema in each instance be prevented by previous admixture of the toxins with scarlatinal antitoxin and (3) that the erythema caused by each toxin be unaffected by previous admixture of the toxin with diphtheria antitoxin. Using these criteria the author found that ten of the nineteen strains of hemolytic *Staphylococcus aureus* produced a soluble erythrogenic exotoxin which caused an erythematous reaction in the skin of Dick positive human subjects and was specifically neutralized by previous admixture with scarlatinal antitoxin.

In the following year von Bormann<sup>31</sup> working in the same laboratory published an extensive study of erythrogenic toxins contained in filtrates of various bacteria. Among the organisms studied were thirty-eight strains of hemolytic *Staphylococcus aureus*, a few from cases of scarlet fever but the majority having no known relation to the disease. Seventeen of the thirty-eight strains produced an erythrogenic toxin which could be specifically neutralized by scarlatinal antitoxin compared with the hemolytic streptococcus. It is of interest to note that the neutralization by commercial staphylococcus antitoxin was less effective than by the scarlatinal antitoxin. An attempt was made to correlate the production of the erythrogenic toxin with that of other staphylococcus toxins such as hemolysin and leukocidin but no such correlation was demonstrable. Parallel tests were made with Dick toxin as a control on healthy subjects and on patients with early and late stages of scarlet fever. The reaction of the skin to the Dick toxin and to that component of the staphylococcus filtrate neutralized by scarlatinal antitoxin was found to be the same in the two groups of patients.

During the past twenty years there has been a continued broadening of the accepted concept of the pathogenesis of scarlet fever. The original hypothesis that the disease is caused by a single toxin produced by a specific strain of hemolytic streptococcus is no longer tenable. Many strains of beta hemolytic streptococci are now known to possess the power of liberating the causative toxin, and streptococcus toxins of more than one antigenic type are capable of causing the disease. The evidence reviewed in the present report invites a further broadening of the etiologic concept of scarlet fever, for the data presented suggest that a clinical syndrome indistinguishable from scarlet fever may result from infection with certain strains of *Staphylococcus aureus*. Preliminary immunologic study of the erythrogenic toxin elaborated by the staphylococcus indicates that it is antigenically related to the standard erythrogenic toxin of the hemolytic streptococcus.

#### SUMMARY

A clinical syndrome indistinguishable from that of scarlet fever and associated with staphylococcal osteomyelitis and bacteremia was observed in a patient from whom no beta hemolytic streptococci could be cultured. The strain of hemolytic *Staphylococcus aureus* isolated from the patient's blood was found to produce a filtrable erythrogenic toxin which was neutralized by commercial scarlatinal antitoxin. Scarlet fever may occasionally be caused by an erythrogenic toxin produced by certain strains of staphylococci.

## ADIE'S SYNDROME

### ITS RECOGNITION AND IMPORTANCE

JOHN B. DYNES, MD

BOSTON

The symptom complex of absent tendon reflexes and tonic pupils has been termed Adie's syndrome. Its cause remains unknown. Its importance lies in distinguishing this symptom complex from syphilis of the central nervous system. Neurologists and ophthalmologists are familiar with Adie's syndrome. There have been numerous publications in the literature of those specialties. It seems worth while to call the attention of the general practitioner to this symptom complex, as it is frequently mistaken for syphilis of the central nervous system even in the absence of positive serologic reactions.

The tonic pupil was first described by Saenger<sup>1</sup> in 1902. Markus<sup>2</sup> in 1906 first associated absent tendon reflexes with tonic pupils in a boy of 12 years. The same case was reported by Weber<sup>3</sup> in 1933 after an interval of twenty-seven years. The patient was in good health with normal offspring illustrating the benign character of the disorder. Prior to the last decade most reports suggested that this syndrome of absent reflexes and tonic pupils was associated with Argyll Robertson pupils. Moore<sup>4</sup> in 1925 wrote on the nonsyphilitic Argyll Robertson pupil. Holmes<sup>5</sup> and Adie<sup>6</sup> in 1931 called attention to this syndrome which simulates syphilis of the central nervous system. In 1932 Adie<sup>7</sup> reaffirmed the benign character of this disorder, which has since come to bear his name.

The term tonic pupil is one that requires description so that it may be recognized. A tonic pupil is one having a delayed or slow response to accommodation and convergence. Not only is the response delayed but, in addition there is an over-response, as shown in the accompanying illustration (case 1). The pupil constricts more than the normal pupil under the same stimulus. This tonic pupil may respond slowly to bright light. The pupil not only constricts gradually but also dilates in the same manner after the stimulus has been withdrawn. The tonic pupil is usually unilateral although it may be bilateral. The abnormal pupil is usually larger than the normal pupil. This tonic pupil reacts normally to both atropine and physostigmine. It is constricted with acetyl-beta-methylcholine chloride<sup>8</sup> whereas the unaffected pupil is not constricted. These findings are quite in contrast to the reactions of the Argyll Robertson pupil. With the latter condition the pupils are usually miotic, bilateral and fixed to light stimulation but react promptly to convergence. In the Argyll Robertson pupil there is either a history or both clinical and serologic evidence of

syphilis, while in Adie's syndrome the history and serologic reactions are negative

The tendon reflexes most frequently absent in Adie's syndrome are the achilles and patellar reflexes, although all tendon reflexes may be absent. In contrast to tabes dorsalis the patient with Adie's syndrome has no loss or disturbance of vibratory or position sense, and none of the superficial sensory disturbances, lightning pains or gastric crises seen in tabes dorsalis.

There are variations in Adie's syndrome. Adie<sup>7</sup> believed that there were four phases representing incomplete stages which may go on to the complete form of tonic pupils and absent tendon reflexes. On one end of the scale he placed those patients having tonic pupils alone and on the other end those with absence of reflexes alone. In the intermediate positions he placed those having atypical phases of tonic pupils alone and those having atypical pupils with absence of one or more tendon reflexes. Most neurologists believe it is a mistake to classify patients as having this syndrome who have only absent reflexes. It will be noted in this present series of patients that both the complete and incomplete Adie's syndrome are represented.

#### REPORT OF CASES

**CASE 1**—A housewife aged 34 was previously told that she had a serious disease, and it was inferred that she had syphilis in spite of repeated negative results of blood and spinal fluid examinations. She became apprehensive and very nervous and complained of fatigue, many aches and pains, sweating and palpitation. She had had a nonvenereal pelvic inflammation following an ectopic pregnancy. The right pupil was larger than the left and constricted slowly to strong light stimulation. There was also a slow constriction with prolonged convergence, the right pupil becoming even smaller than the left. The right pupil dilated slowly. The left pupil reacted normally to light and convergence. Tendon reflexes were generally absent. There was no loss of vibratory or position sense and no cutaneous sensory abnormalities. The patient had only slight complaint referable to her eyes, with blurring on accommodation (figs 1 and 2).

**CASE 2**—A housewife aged 50 had no visual symptoms or complaints. A diagnosis was made originally of tabes dorsalis. There was a general absence of tendon reflexes. The left pupil was larger than the right and irregular and reacted slowly to strong light and convergence. The patient had congenital heart disease with decompensation.

Fig 1—Adie's syndrome (case 1). The left pupil is the tonic pupil and is slightly larger than the right, pupils at rest.

**CASE 3**—A housewife aged 62 had symptoms of easy fatigue, dizziness, flushing, sweating and loose bowel movements with emotional excitement. There was evidence of mild, generalized arteriosclerosis. The tendon reflexes were generally absent. Vibratory and position sense were intact. The pupils were irregular, the left larger than the right, and they reacted slowly to both strong light and convergence. The right pupil responded normally to light and convergence. There were no symptoms related to the eyes. The patient had roentgenologic evidence of monophasic Paget's disease affecting the skull.

**CASE 4**—A salesman aged 41 had always been nervous. He had long-standing functional indigestion, gas and occasional loose bowel movements. He was worried about his heart and showed considerable anxiety. He had a history of alcoholic addiction without psychosis. The right pupil was irregular,

larger than the left, and reacted slowly to strong light and to prolonged convergence. The left pupil reacted normally. The tendon reflexes were present and active.

**CASE 5**—A man aged 45 had a history of gonorrhea twenty years previously, he denied having syphilis. He complained of "nervous stomach" with attacks of indigestion for five years. He had always been nervous but had had no specific complaints until, following a cold with cough six months previously, dryness of the mouth, loss of sweating, constipation, loss of libido and dizziness developed. The patient had low blood pressure and six months later a typical orthostatic hypotension developed, with dizziness and fainting attacks. Both pupils were irregular and reacted slowly to strong light and prolonged convergence. The tendon reflexes were absent at the knees and ankles. There was no loss of vibratory or position sense.

Fig 2—Over response of the left pupil to convergence.

**CASE 6**—A housewife aged 53 had had a dilated left pupil for thirty years. In recent years this dilated pupil had constricted. Formerly a diagnosis was made of "burnt out" tabes dorsalis. Both pupils were irregular and apparently fixed to light but reacted slowly to strong light and prolonged convergence. She had a mild photophobia and conjunctivitis. The tendon reflexes at the ankles were absent. The right patellar reflex was more active than the left. The patient was in the menopause. She was very nervous, had hot flashes, fatigue and hypertension, with blood pressure of 160 mm systolic and 80 mm diastolic to 190 mm systolic and 100 mm diastolic. There was no loss of vibration or position sense.

**CASE 7**—A housewife aged 38 had slight blurring of vision with strong light. After her husband's death she became very nervous and had palpitation and lack of emotional control. The patient's father had had a nervous breakdown with depressive symptoms. The right ankle jerk was absent. The remainder of the tendon reflexes were obtained only with reinforcement. The left pupil was larger than the right. The pupils reacted slowly to strong light and prolonged convergence.

**CASE 8**—A student aged 14 years was nervous, restless and worried about her health. She had acne of the face. The teacher at school noted that the right pupil was larger than the left and sent the patient for an ophthalmic examination. She had no symptoms referable to the eyes. The right pupil was dilated and larger than the left. It reacted slowly to strong light and prolonged convergence. The right achilles reflex was absent. The other tendon reflexes were present with reinforcement. There was no sensory abnormality. Vibratory and position sense were intact.

#### COMMENT

The etiology and pathogenesis of Adie's syndrome remain unknown. The association of this syndrome with other disorders,<sup>10</sup> such as influenza, polyneuritis, encephalitis, multiple sclerosis, orthostatic hypotension, vitamin deficiencies and endocrine disorders, particularly hypothyroidism,<sup>11</sup> has been suggested. In the present series of patients presenting this syndrome, the most frequently met symptoms were nervousness and emotional disorders, with such symptoms as palpitation, sweating and the associated anxiety and fear states. Kennedy and his associates<sup>12</sup> drew attention to the

9 Dr. Davis G. Cogan, Howe Ophthalmological Laboratory, granted the opportunity to examine 2 of these patients (7 and 8).

evidence of instability of the autonomic nervous system associated with emotional disturbances in patients with Adie's syndrome, and our series of cases confirms this observation.

Most of the patients with this syndrome consult the physician for entirely different complaints, and the tonic pupils and absent tendon reflexes are found only incidentally in the course of the examination. Symptoms of blurred vision, occasional ocular pain or photophobia may be associated with tonic pupils. Not infrequently the patient's original complaint is lost sight of in the presence of these apparently more ominous findings. Many patients have been told that they have a serious disorder or a syphilitic disorder and have at times been given treatment for syphilis in spite of negative serologic reactions. Although Adie's syndrome when typical is sufficiently characteristic to make a diagnosis, one should not fail to rule out syphilis by complete studies.

Adie's syndrome is a benign disorder and requires no therapy unless it is psychotherapy, particularly if the patients have previously been told that they suffer from syphilis or some serious disorder requiring special treatment.

#### SUMMARY

Adie's syndrome is a symptom complex with absent tendon reflexes and tonic pupils as the outstanding characteristics. The cause of this syndrome remains unknown. Its importance lies in distinguishing this symptom complex from syphilis of the central nervous system. Tonic pupils may be distinguished from Argyll Robertson pupils. Adie's syndrome is a benign disorder, requiring no special therapy.

## Clinical Notes, Suggestions and New Instruments

### HYPERSENSITIVENESS TO A MERCURIAL DIURETIC

WITH OBSERVATIONS ON ITS MECHANISM

THEODORE FOX M.D. HARRY GOLD M.D. AND  
JEROME LEON M.D. NEW YORK

Acute toxic reactions following the use of organic mercurials as diuretic agents have received considerable attention in recent publications.<sup>1</sup> The present report deals with an unusual response to these compounds used as diuretics in a case of advanced congestive heart failure. Experiments were performed which throw some light on possible factors that might be involved in the mechanism of this reaction. The observations on our patient cover about five years.

#### REPORT OF CASE

A G. was an unmarried woman aged 27 when she came under observation. She had rheumatic heart disease, with decided enlargement of the heart, mitral stenosis and insufficiency, auricular fibrillation and an advanced grade of heart failure with congestion.

She appeared to have been hypersensitive to a wide variety of foods which occasionally produced hives. Her history embraced the details commonly encountered in that of a patient with rheumatic heart disease although there was no history of polyarthritis or chorea. The heart disease was discovered at the age of 10 years, at which time she was confined to bed for about two years with active carditis but without heart failure. The next twelve years, until she was 22, were

uneventful. At the end of that period (1933) heart failure began. Up to the present time there have been three episodes of severe failure, for which she was confined to bed. Recovery was not complete from the previous two attacks. She came under our observation during the third attack.

The physical observations during the early period of the last attack of failure were as follows. The patient was frail, weighing 125 pounds (56.7 Kg.). There were severe dyspnea, orthopnea, edema up to the lumbar region, pulmonary rales and ascites. The veins of the neck were distended. The lower edge of the liver was at the level of the umbilicus. There was a systolic murmur over the entire precordium and a rumbling diastolic murmur at the apex. The ventricular rate was 70 a minute. The electrocardiogram showed auricular fibrillation. There was no pulse deficit. The blood pressure was 124 systolic and 66 diastolic. A teleroentgenogram showed decided enlargement of the heart with straight left border.

The laboratory data were not significantly abnormal. There was a trace of albumin in the urine. The urine had a specific gravity of 1.020. There were occasional red blood cells and no white blood cells in the urine. The blood sugar was 103 mg., nonprotein nitrogen 33 mg. and uric acid 84 mg. per hundred cubic centimeters. These values were not significantly changed after treatment with the mercurials: blood sugar 85 mg., nonprotein nitrogen 37 mg., uric acid 53 mg. and creatinine 13 mg. per hundred cubic centimeters. The red blood cell count was 5,376,000, the hemoglobin content 15.2 Gm. and the white blood cell count 8,300, with segmented neutrophils 68 per cent and eosinophils 1 per cent. The red blood cell sedimentation rate was 2 mm. in forty-five minutes. The Kahn and Wassermann reactions of the blood were negative.

Some of the present observations were made while the patient was in bed in the hospital and others when she was ambulant, after being discharged from the hospital. While she was in the hospital a daily record was made of her body weight and the daily water intake and output were charted. The urine was also examined daily, especially for albumin casts and red blood cells. It may be noted at this point that nine daily examinations of the urine during the experiments with the organic mercurials showed no significant changes from the controls before the treatment was started.

The patient received a daily dose of  $1\frac{1}{2}$  grains (0.1 Gm.) of digitalis throughout the period of study. This maintained the ventricular rate at a level varying between 70 and 85 a minute except during a period of fever when the ventricular rate rose to 106.

It may also be noted that the use of the mercurial diuretics resulted in a sharp reduction in the signs and symptoms of heart failure, with a loss of 18 pounds (8 Kg.) of edema fluid. She improved sufficiently to become virtually free of symptoms with moderately restricted physical activities.

The unusual reactions produced by the mercurial diuretics in her case became the subject of a special study, which is the point of particular interest in this presentation.

The accompanying chart shows the types of reactions following the organic mercurials. Within less than ten minutes following an intravenous injection of 0.5 cc. of mercurpurin there appeared a series of symptoms, which grew in severity during the next twelve hours. The skin became flushed at times there was a blotching and at other times a diffuse erythema. The conjunctivas became congested. Paresthesias appeared in the skin and mucous membranes with a sensation of 'pins and needles' throughout the body, pruritus and numbness of the cheeks and tongue. There was substernal constriction and epigastric pressure, salivation, nausea and vomiting, swelling of the lips, soreness of the mouth and blurring of vision. The vision became so blurred that she was barely able to recognize objects. The temperature rose to 103 F. within seven hours. The blood pressure showed no significant changes. The urine showed no increase of albumin or red blood cells. These symptoms subsided within about seventy-two hours. The severity of the symptoms and their duration varied greatly with the dose and the type of mercurial. In the case of the larger doses the soreness of the mouth progressed to grayish ulceration, which lasted for as long as eight days.

From the Department of Pharmacology of Cornell University Medical College, New York; the Cardiac Services of the Hospital for Joint Diseases, New York; and Sea View Hospital, Staten Island, N. Y.  
1. Tyson, Mary C. Danger of Intravenous Mercurial Injections in Nephrosis. *J. A. M. A.* 117: 998 (Sept. 20) 1941. Friedfeld, Louis. Nussin, Milton. Modell, Walter, and Sussman, Ralph. Mercurpurin (letter to editor). *ibid.* 117: 1806 (Nov. 22) 1941.

It may be noted that all the organic mercurials produced some reaction, namely, intravenous mercupurin, salyrgan, neptil and the mercurin suppository. The reaction to salyrgan and neptil was almost negligible, however. In the case of these, there occurred a sensation of "pins and needles" within a few minutes after the injection. Vomiting often occurred within a few hours. The temperature did not rise. The patient later prevented the vomiting by taking the injection on an empty stomach and came without food the rest of the day. In the course of time she learned to ignore the slight discomfort produced by the salyrgan. The intravenous mercupurin or mercurin suppository, however, caused a very severe and dangerous reaction.

Experiments were designed to learn something of the mechanism of the reaction to the mercurials. It is known that massive diuresis will sometimes cause a severe reaction. Since the first dose produced a diuresis of about 3 liters, this was a possible cause of the reaction. It proved in this case, however, not to be a significant factor, since a similar reaction was caused by mercupurin at a time when the patient was relatively free of edema fluid and no copious diuresis occurred.

Since mercupurin contains some theophylline in solution (about 50 mg per cubic centimeter) the possibility that the patient might be sensitive to the xanthine content was explored. As may be seen in the chart, however, an intravenous injection of a solution containing 100 mg of aminophylline alone (about 70 mg of theophylline) caused no reaction. Such a dose together with 1 cc of salyrgan also failed to alter the slight reaction caused by salyrgan alone. It is clear, therefore, that the reaction is not caused by the xanthine content of the organic mercurial.

The accompanying table summarizes the results of these and of subsequent experiments. The possibility that the reaction might be due to the fact that the body breaks up the organic compound of mercupurin and liberates more toxic ionizable mercury was studied. Tests were made with other forms of

reaction. It is clear, therefore, that the reaction to the mercupurin was not the result of the liberation of ionized mercury. It may be noted that the 20 mg of mercury bichloride caused a diuresis resulting in a loss of body weight of 3 pounds (1.36 Kg) in twenty-four hours, or 60 per cent of that following the usual intravenous dose of 2 cc of salyrgan (80 mg of mercury).

Reaction of Patient to Organic Mercurial

| Day       | Drug                       | Dose                         | Content of Mercury Mg | Reaction |

All doses were given intravenously except mercurin

Types of reactions following organic mercurials

mercury. The results are seen in the table. The patient showed no reaction to an intravenous injection of 20 mg of the highly ionizable mercury bichloride or to as much as 20 mg of the poorly ionizable mercuric oxycyanide in 1 per cent solution. These doses represent about four times as much mercury as is present in 0.1 cc of mercupurin, which caused a rather severe

The possibility that the liberation of histamine in the initial allergic reaction to the mercupurin might play a part in the subsequent production of the typical mercury poisoning (ulcerative stomatitis) was tested in one experiment. This hypothesis, however, received no support from the results. A dose of 0.25 mg of histamine hydrochloride was given subcutaneously. Five minutes later the usual dose of 2 cc of salyrgan was injected intravenously. Symptoms appeared ten minutes after the histamine injection: flushing of the face, sense of heat and fullness of the head. There was no rise of temperature. These symptoms subsided within an hour. They appeared to be the customary effects of histamine. No intensification of the usual mild salyrgan reaction was apparent. The usual diuresis with loss of 4 pounds (1.8 Kg) of body weight followed.

The reaction to a cutaneous scratch test for hypersensitiveness to the mercupurin proved negative. The test was made with the full strength ampule solutions of mercupurin and salyrgan on separate areas of the forearm. Isotonic solution of sodium chloride was used for additional control. The observations extended over two hours. A slight elevation appeared at the site of the scratch without itching, erythema or pseudopodia. The scratch with mercupurin was indistinguishable from that with salyrgan.

Severe reactions followed all three doses of mercupurin, even a dose of 0.1 cc given intravenously. The most severe one followed a dose of 2 cc intravenously. The patient became desperately ill, and ulceration of the mouth developed, lasting as long as eight days.

The mercurin suppository was used on two occasions. Both times the reactions were as severe as with 2 cc of mercupurin intravenously.

In the case of salyrgan, more than two hundred injections at weekly intervals were given. The dose was usually 2 cc containing approximately 80 mg of mercury. The reaction was negligible.

The hypersensitiveness to the organic mercurial in this patient seemed to remain fixed during a period of years. Her reaction in 1942 was similar to that in 1937.

2 Poll, Daniel, and Stern, J. E. Untoward Effects of Diuretics with Special Reference to Mercurial Diuretics. Arch. Int. Med. 58: 1087 (Dec.) 1936.

# SUMMARY AND CONCLUSIONS

We have encountered a case of severe hypersensitiveness to mercupurin by intravenous injection and to mercurin by rectal suppository.

This patient also exhibited a slight toxic reaction to the other mercurial diuretics but in the case of the others the reaction was negligible.

The continued administration of salyrgan did not result in any appreciable change in the character of the reaction.

The extreme susceptibility to mercupurin was seen from the fact that as little as 0.1 cc., containing only 4 mg. of mercury, produced a severe reaction, with fever, rash, nausea and vomiting, thoracic constriction, paresthesias and swelling of the lips.

This reaction was not related to the degree of diuresis.

The reaction was not due to the liberation of a more toxic ionized mercury. There was no hypersensitiveness to mercury bichloride.

The reaction showed two phases: (1) a nonspecific allergic reaction which came on within a few minutes, namely flushing, a rash and swelling of the lips; and (2) symptoms characteristic of mercury poisoning, namely ulcerative stomatitis. With the smaller doses only the first phase appeared, with the larger doses both were present.

The hypersensitive reaction precluded the use of mercupurin by intravenous injection and of mercurin by rectal suppository. It was not necessary, however, to abandon the mercurials which were essential in this case for the control of the edema, since salyrgan was tolerated in large doses by intravenous injection with negligible reaction.

## EWING'S TUMOR OF THE SACRUM

### FIVE YEAR SURVIVAL AFTER IRRADIATION

J. I. SLOAT, M.D., ATLANTA, GA.  
Colonel, U. S. Army

AND

LEONARD T. PETERSON, M.D., WASHINGTON, D. C.  
Lieutenant Colonel, U. S. Army

Ewing's tumor of the sacrum is rarely encountered. In 125 cases of Ewing's tumor reported by Geschickter and Copeland,<sup>1</sup> the neoplasm involved the pelvis in 12, in none of which it occurred in the sacrum, and none of the patients lived over thirteen months. Of the total number of patients 99 were followed and only 6 survived five years. Brav and Rechtman<sup>2</sup> in 1938 reported a case in which a 10 year old child lived fourteen months with roentgen therapy. They stated that they were unable to find a similar case in the literature.

Malignant tumors of the sacrum include Ewing's tumor, chordoma, myeloma, osteogenic sarcoma and metastatic tumors. The characteristic roentgen appearance is that of a destructive lesion of the sacrum. Because of the diffuse nature of the lesion its destructiveness may not be readily apparent unless the bone density is carefully compared with that of the surrounding pelvis. The final diagnosis depends on the biopsy and the response to therapy. In all cases of Ewing's tumor resection or amputation with irradiation offers the best prognosis for a five year cure.

The patient who is the subject of the present report has survived five years. The case is of interest also because it presents a differential diagnosis in sacral pain and because it emphasizes the importance of palpation of the sacrum as well as of the prostate in rectal examination.

### REPORT OF CASE

J. T., a white man aged 21, was admitted to Tripler General Hospital, Honolulu, T. H., Oct. 10, 1936, with sacral pain of one month's duration which had gradually increased in severity.

The pain was most severe on flexion and extension of the spine and was especially severe at night. The patient's general health was good, and he had no other complaints except increasing constipation and slight urinary difficulty during the previous two weeks. He was ambulatory and afebrile. His normal weight was 144 pounds (65 kg.) and the present weight

Fig. 1—Decreased density in the sacrum on Nov. 22, 1936, two and one-half months after onset of symptoms.

was 127 pounds (57.6 kg.). The special senses, the abdomen, heart and lungs were normal. There was no adenopathy. The blood pressure was 128 mm. or mercury systolic and 78 mm.

Fig. 2—Appearance on May 24, 1937, after operative removal of coccyx and roentgen therapy. The sacrum has normal density.

diastolic. Serologic examination gave negative results. Rectal examination revealed no tenderness or enlargement of the prostate and no mass was discovered. The nervous system and the extremities were normal and there was no sciatic radiation of pain. The patient walked cautiously because of pain. Roentgen

From Lawson General Hospital and Walter Reed General Hospital.

2. Brav, E. A. and Rechtman, A. M. Primary Endotheliomyeloma (Ewing's Tumor) of the Sacrum. J. Bone & Joint Surg. 20: 1034 (Oct.) 1938.

examination showed sacralization of the right fifth transverse process, and there was haziness in the right sacroiliac joint.

On November 15 he first noticed impaired sensation in the genital region. The second rectal examination revealed a large, firm, circumscribed tumor mass, 10 cm in diameter, in the hollow of the sacrum and weakness of the sphincter. On November 25 aspiration of the tumor mass was attempted under local anesthesia to rule out abscess formation, but no pus was obtained.

On December 9, under spinal anesthesia with 150 mg of procaine hydrochloride, a posterior incision was made with removal of the coccyx. There was a gush of necrotic hemorrhagic material from a large cavity in the region of the sacrum. This cavity contained fragments of bone, tumor tissue and clotted blood. The cavity was picked, and the wound was partially closed. The clinical diagnosis was sarcoma of the sacrum. Rectal examination immediately after operation showed no decrease in the size of the mass. Diagnosis on frozen section was sarcoma, on the basis of the fixed specimen it was Ewing's tumor.

This case is carried by the Bone Tumor Registry under number 2319 (diagnosis 3 Ewing's sarcoma 2 Reticulum cell sarcoma). The following description of the microscopic picture of the tumor (accession 528630) is furnished by Col J E Ash, curator of the Army Medical Museum.

"Microscopic examination showed small fragments of cancellous bone, the spaces of which were filled with cell masses of the reticulum cell type. The cell nuclei were uniform,

Fig 4—Section of tumor under low power

oval and slightly irregular in contour. The nucleoli were small. The cell outlines were indistinct. No intercellular substance was identified. The neoplastic cells were seen invading the fibrous stroma. The diagnosis of Ewing's tumor was made. High voltage roentgen therapy was started immediately. The packing was completely removed on the tenth day, and the

wound quickly healed. The patient had complete relief of pain soon after operation and roentgen therapy. Rectal examination on December 30 showed that the mass was softer but was still the same size. Roentgen examination now showed considerable destruction of the sacrum. The chest did not show metastasis. Rectal examination on Jan 11, 1937, one month after operation and roentgen therapy, showed a substantial decrease in size of the tumor. The patient received a total of 7,000 roentgens (1,400 roentgens to each of five ports).

He was returned to the United States and was admitted to Walter Reed General Hospital, Washington, D C, on February 20. Physical examination at that time gave essentially negative results. Roentgenograms showed absence of the coccyx and of the destructive lesion involving the lower portion of the sacrum, which had been more extensive on the right side. Complete genitourinary study showed no pathologic condition. Two further courses of roentgen treatment were given, with a total of 4,611 and 2,522 roentgens respectively. He was returned to duty on September 24 and was subsequently discharged from the Army on expiration of enlistment without apparent disability.

#### FOLLOW-UP EXAMINATION

The patient returned for follow-up examinations at the orthopedic clinic of Walter Reed General Hospital on June 20, 1938, Oct 24, 1939 and Oct 6, 1941. He has remained in excellent health, and no evidence of local or metastatic involvement has been discovered by rectal examination and roentgen examination of the chest and pelvis. On the last visit he weighed 148 pounds (67 Kg) and was working as a machinist in a navy yard.

#### SUMMARY

In an unusual case of Ewing's tumor of the sacrum, five year survival followed biopsy and intensive roentgen therapy.

#### CHRONIC PULMONARY CHANGES AND BRONCHIAL ULCERATION IN AN ELECTRIC ARC WELDER

H R NAYER M.D., NEW YORK

In 1936 Doig and McLaughlin<sup>1</sup> first described chronic roentgenographic changes in the lung fields of 16 arc welders. Subsequently Enzer and Sander<sup>2</sup> and Sander<sup>3</sup> reported similar findings in 10 of 26 welders examined. The roentgenographic abnormalities, discovered by surveys on apparently healthy workers, ranged from increased hilar shadows to a generalized fine or nodular mottling simulating silicosis. In all cases silicosis could be ruled out by the occupational history. The workers had no symptoms and were not disabled in any way. There was a history of long exposure to the products of arc welding, usually fifteen years or more. Those arc welders who showed pulmonary changes had, at some time, worked in a confined or poorly ventilated space for at least two years. Autopsy on one man who died in an accident revealed extensive intracellular deposition of iron pigment in the lungs and tracheo-bronchial nodes. There was no evidence of any reaction to the iron.<sup>2</sup> The roentgenographic changes were apparently produced simply by the accumulation of the iron pigment.

Electric arc welding is a method of fusing metals in which an arc is sustained between a metal electrode and the material to be welded. During the procedure the electrode is consumed and forms the filler material, it is therefore common practice to use electrodes of a composition similar to that of the metal to be subjected to welding. The commonly used mild steel electrode consists of approximately 99 per cent ferrous material with minute amounts of such alloy substances as carbon, manganese, phosphorus, silicon and nickel. At present the trend

From the Medical Service of Dr A A Epstein, Beth Israel Hospital. Dr M L Som gave permission to report this case and Dr Harry Wessler gave helpful suggestions.  
<sup>1</sup> Doig, A T, and McLaughlin, A I G. \ Ray Appearances of the Lungs of Electric Arc Welders. *Lancet* 1: 771 (April 4) 1936.  
<sup>2</sup> Enzer, Norbert, and Sander, O A. Chronic Lung Changes in Electric Arc Welders. *J Indust Hyg & Toxicol* 20: 333 (May) 1938.  
<sup>3</sup> Sander, O A. Respiratory Hazards of Electric Arc Welding. *Indust Med* 8: 177 (May) 1939.

is to use coated electrodes which are more efficient. The coating produces a gas shield which prevents contact of the atmosphere with the molten metal. The coated rods also produce more heat and prevent heat loss. Many coatings are secret trade formulas but it is known that they are composed of various materials such as fluorides, silicates, borates, aluminum and chromium. Fumes arising from coated rods are largely inorganic material consisting of finely divided iron oxide, the average particle is less than 0.5 micron.<sup>4</sup> Observations on animals exposed to the fumes of arc welding with uncoated electrodes reveal evidence of iron deposition in the lungs with transportation of this material to the periphery of the lungs and to the tracheobronchial lymph nodes.<sup>5</sup>

The clinical literature on these chronic pulmonary changes remains relatively sparse and case reports are few. In view of the importance of arc welding particularly in this period of industrial expansion this subject merits further attention. Furthermore, the case to be reported presented several unusual features some of which have not been previously described.

#### REPORT OF CASE

**History.**—A K, a white man aged 30 admitted to the hospital on April 10, 1941 complained of cough and difficulty in breathing of one year's duration. About one year before admission he had noted the gradual onset of dyspnea progressing in severity and increasing with effort. At the same time he began to cough and expectorated moderate amounts of tenacious nonfoul whitish sputum. His symptoms increased and the sputum became purulent. There had been no chest pain or hemoptysis and his general condition remained fairly good.

**Occupational History.**—He had worked steadily as an electric arc welder for the past seven years. All his work was in building and ship construction and he had worked with ordinary structural steel using coated electrodes. In accordance with the general practice he had worn the welder's helmet which protects against injury from heat and light but does not prevent the inhalation of fumes. As far as he could recall these fumes had not produced any symptoms in him or his fellow workers.

Unfortunately, during his hospital stay no data were elicited with regard to work in poorly ventilated spaces. His most recent work had been in ship building and it is probable that some of this welding had been carried out in poorly ventilated surroundings.

**Physical Examination.**—On admission he was afebrile. He was moderately dyspneic at rest; there was no orthopnea or cyanosis. The trachea was deviated to the right and was freely movable. The fingers were not clubbed. A persistent rhonchus was heard over the right lung in addition to inconsistent rhonchi scattered over both lungs. There was a short systolic blow over the apex. The remainder of the physical examination disclosed no abnormalities.

**Laboratory Data.**—The hemoglobin amounted to 95 per cent (Sahl). The red blood cells numbered 4.4 million and the white blood cells 8100, with a normal differential count. The Wassermann reaction of the blood was negative. The urine was normal. Sputum cultures showed a variety of organisms, including *Staphylococcus albus* and hemolytic and nonhemolytic streptococci.

**Course in the Hospital.**—The admission roentgenogram showed multiple linear and nodular densities traversing the middle third of the right lung from the root out to the periphery. There was also some exaggeration of the linear markings of the left lung as shown in the accompanying illustration. The tentative diagnosis on admission was bronchogenic carcinoma with lymphangitic spread.

Bronchoscopy (Dr. M. L. Som) four days after admission revealed a considerable amount of purulent material in the lower part of the trachea. The tracheal bifurcation was distorted so that the lumen of the left main bronchus was narrowed and could not be entered. There was an ulcerated

granulating lesion on the anterior wall of the right main bronchus just below the bifurcation. A large amount of non-tough purulent secretion was seen distal to this lesion. Sections of this granulation tissue removed by biopsy, showed non-specific inflammatory changes with large masses of iron pigment scattered about. The pus from the bronchi was studied for fungi with negative results.

In order to relieve the patient's obstructive symptoms the bronchoscopist decided to remove the granulation tissue from the right side and to dilate the left main bronchus. Accordingly, bronchoscopy was done on five further occasions during the patient's hospital stay of approximately one month. Three further specimens from the lesion in the right main bronchus showed non-specific inflammation and fibrosis with large masses of iron pigment. The left main bronchus was dilated to a diameter of about 9 mm so that the bronchoscope could be passed beyond. During the sixth and last bronchoscopy two days before the patient's discharge no ulcer was seen and the right main bronchus appeared normal, the lumen of the left main bronchus was now widely patent.

Following the fifth bronchoscopy there was a short period of massive collapse of the left lung, apparently caused by a mucous plug. Aside from this episode, the patient's course was satisfactory. His dyspnea and cough were greatly relieved and his general condition improved. Roentgenograms of the chest throughout were unchanged. He was discharged on May 17, 1941 and returned to work.

When last seen by his private physician on Oct. 11, 1941<sup>6</sup> he was still bringing up some purulent sputum. He was working and had gained 13 pounds (6 Kg.) and his general condition was fairly good. A roentgenogram of the chest showed no change as compared with changes of May 1941.

#### COMMENT

On the basis of the occupational history and roentgenographic findings in the chest this patient can be classified as an electric arc welder with chronic pulmonary changes in the same category with the cases previously described in the literature. He presented, however, several unusual features. He had been an arc welder for seven years, in the other cases reported in which the time spent in this occupation has been noted the average exposure has been eighteen years. In contrast to the absence of symptoms hitherto noted, this man suffered from cough, sputum and dyspnea. These symptoms seem to have been produced primarily by the bronchial involvement with resulting distal infection, they cleared to a considerable degree when the bronchial obstruction was relieved.

Bronchial lesions accompanying chronic pulmonary changes in electric arc welders have not been previously reported. The mechanism whereby these bronchial changes were produced is not clear. Whether these were due to irritation by one or more of the alloy substances present in the steel such as chromium and phosphorus, by pressure of enlarged lymph nodes or by some other mechanism cannot be stated. I simply wish to call attention to this involvement of the major bronchi in an arc welder in the hope that further observations may help to clarify the problem.

575 West End Avenue

Linear and nodular densities throughout the right lung on admission. There are also some infiltrations in the region of the left hilus and increased markings in the middle third of the left lung.

ACUTE AGRANULOCYTOSIS FOLLOWING SULFADIAZINE

JOHN J. CURRY, M.D., Boston,  
Assistant Resident in Medicine, Robert Dawson Evans Memorial,  
Massachusetts Memorial Hospital

Toxic symptoms following the use of sulfadiazine in comparison with those following the other sulfonamides are mild and infrequent.

A decrease in the leukocyte count below 5,000 per cubic millimeter of blood with or without a decrease in the granulocytes occurs not uncommonly during the course of sulfamonomide and less often during sulfapyridine and sulfathiazole therapy.

Leukopenia following sulfadiazine administration has been observed. In a total of 776 cases, the incidence was 1.67 per cent. Keefer<sup>1</sup> reports an incidence of 2 per cent.

Acute agranulocytosis occurring after sulfadiazine therapy has not been reported. For this reason it was felt that the following case should be recorded.

REPORT OF CASE

A white woman aged 41, married, entered the medical wards of the Boston City Hospital on Sept. 24, 1941, because of jaundice of five days' duration.

Laboratory Studies of Blood During Period of Hospitalization

| 11/9  |                            | 60                           | 4,600                   |              |      |                  |
| 11/17 |                            | 72                           | 5,500                   |              |      | 12               |

The present illness began about two weeks previously with an episode of nausea and vomiting which persisted for five days. This was followed by prolonged nausea and anorexia. She had been taking moderate amounts of alcoholic beverages daily for the past two years. Simultaneously with the onset of jaundice she noted dark colored urine. She never noticed clay colored or tarry stools, although on occasions they were streaked with bright red blood. She had no abdominal pain, loss of weight or pruritus and no intolerance to fried or fatty foods.

On admission to the hospital her oral temperature was 101.6 F, the pulse rate 100 and the respiratory rate 30 a minute.

The patient was well developed, well nourished, jaundiced and moderately ill. There were a few scattered, fine telangiectases over the face. The pupils were normal and the scleras icteric. The chest was resonant on percussion and no rales were heard. The heart was not enlarged, the rhythm was regular and there was a grade 1 systolic murmur at the fourth

left interspace close to the sternum. The blood pressure was recorded as 116 millimeters of mercury systolic and 74 diastolic. The abdomen was soft. The liver edge was easily palpable 4 cm. below the right costal margin, and the surface was smooth and nontender. The spleen could not be felt. Rectal examination revealed external and internal hemorrhoids.

Laboratory work showed that the red blood cell count was 4,490,000 and the white blood cell count 10,550 per cubic millimeter of blood. The hemoglobin concentration was 82 per cent (Sahli). The differential smear revealed 63 per cent polymorphonuclear leukocytes, 16 per cent stab forms, 9 per cent lymphocytes, 4 per cent large lymphocytes and 8 per cent monocytes. The red blood cells and platelets appeared normal in the smear. The Hinton test on the blood serum gave a negative reaction. The blood nonprotein nitrogen was 29 mg. per hundred cubic centimeters and the icterus index 110. The blood prothrombin time was 100 per cent of normal. The hippuric acid excretion test yielded no hippuric acid. The total protein of the blood serum was 5.5 Gm. per hundred cubic centimeters of blood, with the albumin and globulin fractions 2.7 Gm. and 2.8 Gm. respectively. The alcohol-iodine test for bile in the urine was strongly positive, and the urobilinogen test was positive in a dilution of 1:32.

A diagnosis of portal cirrhosis with acute hepatitis was made. The patient was treated with a high carbohydrate, high protein, low fat diet with parenteral vitamins. During the following nine days she improved, with the icteric index dropping to 60. The hemoglobin concentration in the blood was 70 per cent and the leukocyte count 8,200 per cubic millimeter of blood. The temperature curve was intermittently as high as 101 F.

Sulfadiazine was administered on October 3 because of fever and roentgen findings of bronchopneumonia. Two Gm. of the drug was given by mouth and then 1 Gm. every four hours. Ten days later the drug was discontinued but inadvertently begun again the following day. The laboratory studies at this time are shown in the accompanying table. The icterus index dropped to 18. The hippuric acid excretion test yielded 2.1 Gm. of hippuric acid. The bromsulphalein excretion test showed 25 per cent retention at the end of fifteen minutes. The daily urinary output was more than 1,000 cc.

On the twenty-fourth day of chemotherapy the temperature rose to 102 F. The patient became nauseated and vomited. The following day it was discovered that the sulfadiazine had been continued and administration of it was stopped. The blood hemoglobin concentration was 62 per cent. The leukocyte count was 650 per cubic millimeter of blood. A differential smear revealed no polymorphonuclear leukocytes. This smear was reviewed at the Thorndike Memorial Laboratory and the differential count was reported as 1 basophil, 4 small lymphocytes, 7 large lymphocytes, 1 young lymphocyte, 14 monocytes and 12 young monocytes.

She was given 500 cc. of citrated whole blood by vein and 10 cc. of pentnucleotide intramuscularly. The following day the leukocyte count was 1,000 per cubic millimeter of blood, and the differential smear showed 4 per cent stab forms, 1 per cent myelocytes, 10 per cent small lymphocytes, 29 per cent large lymphocytes, 2 per cent young lymphocytes, 2 per cent atypical lymphocytes, 35 per cent monocytes, 12 per cent young monocytes and 5 per cent clasmatocytes. An additional 500 cc. of citrated whole blood was given, following which the leukocyte count rose to 3,200 per cubic millimeter of blood and the differential smear showed 17 per cent polymorphonuclear leukocytes, 31 per cent stab forms, 25 per cent small lymphocytes, 6 per cent large lymphocytes, 18 per cent monocytes, 2 per cent metamyelocytes and 1 per cent myelocytes.

At the time of the toxic reaction it may be seen from the table that the blood sulfadiazine concentration<sup>3</sup> was high. There was no change in the icterus index. The alcohol-iodine test for bile in the urine was negative, and the urobilinogen test was positive in a dilution of 1:6.

There was no untoward reaction from the transfusions, and two days later the temperature dropped to normal. The leuko-

3. Miss Alice Ballou of the Thorndike Memorial Laboratory determined concentrations of sulfadiazine in the blood.

cyte count continued in the vicinity of 4,000 per cubic millimeter of blood and was 5,500 at the time of discharge from the hospital fifty seven days after admission.

## SUMMARY

The case of acute agranulocytosis following sulfadiazine therapy reported here is of interest in that the toxic reaction appeared only with prolonged administration of the drug in therapeutic doses and at a time when the blood concentration of sulfadiazine was high.

Treatment consisted of stopping the drug and of administering penicillin and giving blood transfusions. Following this therapy the patient made an uneventful recovery.

DIPHTHERIA MORTALITY IN LARGE  
CITIES OF THE UNITED  
STATES IN 1941

## NINETEENTH ANNUAL REPORT

The procedure followed in obtaining data for this report has been described in the review of typhoid mortality for these same cities.<sup>1</sup> Briefly, a communication was addressed to the health officer of each of the cities,

# Incomplete data.

hard pressed by the West North Central group. The group rate of 0.17 is slightly lower than that of 1940 (0.20) and less than one half the rate of 1939 (0.37). The new rate represents a new all time low. The West North Central cities are entitled to substantially the same mark of distinction. Twenty-two deaths are recorded in 1941, twenty-six in 1940. Of the former number only three were among nonresidents, in contrast to the relatively high proportion of such deaths in the Southern cities. Ten cities (there were twelve in 1940, nine in 1939) appear in the select list (table 11) with no diphtheria death in 1941 (Buffalo, Camden, Elizabeth, Newark, Reading, Rochester, Scranton, Syracuse, Trenton, Yonkers). Albany reports two deaths both among nonresidents. Rochester records no death for seven years, an impressive accomplishment. Elizabeth reports no death for five years, Yonkers none for four, Trenton none for three years. It is stated that no death from either typhoid or diphtheria has occurred in Yonkers during the last three years, none in Newark for two years, none in Buffalo, Scranton and Trenton during 1941. After seven years without a death, Utica reports one in a resident adult, one death in eight years is a significant record. New York

reports ten deaths, all among residents (ten in 1940, twenty-two in 1939). Philadelphia records three deaths, two among residents. There was no death reported in this city in 1940, there were three in 1939. The record for Pittsburgh has reached a new low (one death among residents in 1941, five deaths, four among residents in 1940). Jersey City reports three deaths among residents, Paterson and Erie, one each.

In obtaining data for the cities of the South Atlantic states (table 3), Charlotte (no death in 1941) has been included for the second time. However, for purposes of adequate comparison, the figures for this city have been omitted in calculating rates for the group as a whole. The number of deaths in the nine remaining cities has increased from seventeen in 1940 to twenty-seven in 1941. Of the latter, seventeen were among residents (equal to the total for 1940) and ten among nonresidents. The rate has increased from 0.62 to 0.99 but remains considerably below that of 1939 (1.52). While in 1940 this group of cities stood in third place, 1941 finds the group in sixth place (the East North Central group and the West North Central group having returned to more advanced standings held in 1939 and during the quinquennium 1935-1939). Two cities (Miami, Charlotte) report no death in 1941, and four other cities (Atlanta, Baltimore, Norfolk, Washington) record one third or more of deaths among nonresidents.

# Incomplete data.

Two cities (Atlanta, Norfolk) have rates in excess of 2.0, but of twelve deaths in these cities seven were among nonresidents. Miami is the only city in this group with no death during the past two years. There is no city without a diphtheria and typhoid death in 1941 (table 12). Baltimore reports five deaths, three among residents, Washington, two, one among resi-

dents Richmond and Tampa each record two deaths among residents (the same as for 1940)

In 1940 Gary was added to the eighteen cities previously included in the East North Central group (table 4). Again the figures for this city have been

| Chattanooga | 39  |
| Sacramento  | 35† |

† One third or more of the reported diphtheria deaths were stated to be in nonresidents.

omitted in the tables for group comparison. The original cities report a slight decrease in the number of deaths from sixty-eight in 1940 to sixty-one in 1941. The rate has decreased from 0.72 to 0.65 (table 16). This group as a whole is in fourth place. Of the sixty-one deaths, only eight were among nonresidents (three in Indianapolis, two each in Detroit and Flint, one in Cincinnati). Chicago reports thirty-four deaths all among residents (thirty-nine in 1940). Nine cities (there were also nine in 1940) record no death in 1941 (Akron, Canton, Columbus, Dayton, Fort Wayne, Grand Rapids, South Bend, Toledo, Youngstown). Flint and Peoria have been dropped from the honor roll, Columbus and Dayton have been added. Seven cities report no diphtheria deaths in 1940 and 1941 (table 10). Akron, Fort Wayne, Grand Rapids, South Bend and Youngstown record no death during the past four years, Canton and Toledo, none for three years. It is stated that no death from either typhoid or diphtheria has occurred in Fort Wayne and South Bend for four years, none in Canton and Grand Rapids for two years, none in Akron in 1941. Four cities in this group in addition to the five in table 12, report no typhoid or diphtheria death among residents (Columbus, Dayton, Toledo, Youngstown). Detroit records seven deaths, five among residents (three in 1940, all among residents). Cleveland reports two, both among residents, but the health commissioner doubts the correctness of the diagnosis in one instance. In 1940 Cleveland reported no death among residents, one among nonresidents. Cincinnati (as in 1940) records four deaths, three among residents.

The cities in the East South Central States (table 5) report the same number (fourteen) of deaths in 1941 and 1940, the rate (1.09) being about one third of the five year average (3.37). Only one group, the

West South Central, records a higher rate in 1941. Two cities (Knoxville, Nashville) report no death, and three additional cities (Birmingham, Louisville, Memphis) record all deaths among nonresidents. The only city in this group reporting deaths among residents is Chattanooga. This city records five deaths. Nine of the fourteen deaths in the cities of this group were among nonresidents. Birmingham and Memphis each report four deaths among nonresidents. The record of six cities in this group is very impressive. While there is no city in the area with no typhoid and diphtheria death, there are three cities (Knoxville, Memphis, Nashville) in which all such deaths were among nonresidents.

The nine cities in the West North Central states (table 6) report a great decrease in the number of deaths and a rate (0.18) comparable with that of the Middle Atlantic states (0.17). There were only five deaths in this group of cities (eighteen in 1940, eighteen in 1939). The rate compares most favorably with the rate of 1940 (0.66) and the quinquennium 1935-1939 (1.33). There were five cities on the honor roll in 1939, four in 1940 and five in 1941 (Des Moines, Duluth, Kansas City, Kan., Kansas City, Mo., Omaha). St. Paul reports but one death, this among nonresidents (also no death from typhoid). Duluth, Des Moines and Omaha record no diphtheria and typhoid death in 1941, Duluth none during the past three years, Des Moines none for two years. Duluth reports no diphtheria death for six years, Des Moines none for five years, Kansas City, Mo., none for two years (table 10).

\* Thirty-nine without Charlotte.

Of the five deaths from diphtheria in the group as a whole, four were among residents (two in St. Louis, one each in Minneapolis and Wichita) and one among nonresidents (St. Paul).

The eight cities of the West South Central states (table 7) report a decrease from forty-one deaths in 1940 (forty in 1939) to thirty-four in 1941. The death rate has decreased from 2.00 in 1940 (1.97 in 1939).

to 166 in 1941. Fifty per cent of the deaths in 1941 (seventeen of thirty-four) were among nonresidents. But one city (Oklahoma City) appears on the honor roll. In four cities (Houston, San Antonio, New

There are two cities on the honor roll (Spokane, Tacoma). Tacoma has continued on the honor list for two years. Long Beach, which previously reported no death in six years, records one death among residents. Salt Lake City, with no death in 1940, reports two among residents in 1941. Of the thirty-nine deaths in the group as a whole, twelve were among nonresidents. Spokane is the only city in the group that reports no diphtheria and typhoid death in 1941. Two cities (Denver, Sacramento) record a rate in excess of 2.0. Denver reports eight deaths, six among residents, Sacramento

\* Charlotte, Gary and Sacramento omitted

Orleans, El Paso) it is stated that one third or more of deaths occurred among nonresidents. Three cities report rates in excess of 2.0 (Fort Worth, Dallas, El Paso). Oklahoma City records no diphtheria and typhoid death in 1941 (table 12). Tulsa reports one death among residents (six in 1940). Houston records four deaths, one among residents (four among residents in 1940). San Antonio reports three deaths, one among residents (nine in 1940, seven among residents). New Orleans records nine deaths, three among residents (twelve in 1940, four among residents). El Paso reports six deaths, two among residents (one among residents in 1940). It is stated that, of seven deaths in Dallas, five were among residents (in 1940 of seven deaths four were among residents). Fort Worth reports four deaths, all among residents (in 1940 there was one death among nonresidents).

In 1940 Sacramento was added to the eleven cities included in the Mountain and Pacific group (table 8). The figures for this city have been omitted in the tables for group comparison. The original cities report the same number of deaths as in 1940 (thirty-nine). This group of cities stands in fifth place, with a rate of 0.93

TABLE 15—Total Diphtheria Death Rates for Eighty-Eight Cities, 1923-1941 \*

† Lacks data for South Bend.  
‡ Lacks data for Oklahoma City for 1925 and 1926.  
\* 1940 Census figures used.

records four, two among residents. It is stated that, of twelve deaths in Los Angeles, eight were among nonresidents (of seventeen in 1940, eight were among nonresidents). San Francisco reports six deaths, all

among residents (six in 1940, four among residents). The health director states that all six fatalities in 1941 were of persons over 25 years of age. Oakland records one death and Seattle two, all among residents, Portland reports three deaths, two among residents, San Diego records four deaths three among residents.

Of the entire ninety-three cities there was one (none in 1940) with a rate of 50 and over (table 14). In this city (El Paso) of six deaths four were among non-residents. The number of cities with no deaths from diphtheria has decreased by one (forty to thirty-nine). The number of cities with rates below 50 has remained at fifty-three. For the eighty-eight cities (table 15) for which data are available since 1923 there occurred two hundred and nine deaths from diphtheria in 1941 significantly lower than for previous years (two hundred and twenty-five in 1940, three hundred and twenty-six in 1939). The rate for this group of cities is for the third consecutive year less than 10. The rate for the ninety-three cities is the same as that for the eighty-eight cities (0.56) and establishes a new low record. The actual number has decreased by sixteen (from two hundred and twenty-nine to two hundred and thirteen). This decrease is far less impressive than that of one hundred and one for the preceding interval (three hundred and thirty in 1939, two hundred and twenty-nine in 1940).

The health officers did not report any extensive outbreaks of diphtheria. There is evidence of a tendency for this disease to become relatively more prevalent among the higher age groups as the protective programs for infants, preschool and school children continue.

## Council on Pharmacy and Chemistry

### REPORT OF THE COUNCIL

THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT  
ALSTIN E. SMITH, M.D., Acting Secretary

#### AMINOACETIC ACID AND ACCEPTED BRANDS OMITTED FROM N N R

Aminoacetic acid was first included in New and Non-official Remedies in 1936. The following brands have been accepted: Aminoacetic Acid-Calco, Aminoacetic Acid-Mal-linckrodt, Aminoacetic Acid-Merck, Aminoacetic Acid-Paul Lewis, Aminoacetic Acid-Pfanstiehl. In considering the acceptance of one of these brands at the time its acceptance period expired it was suggested that the use of this agent for the conditions stated in New and Nonofficial Remedies be investigated. In order to implement this suggestion the following letter was sent to a selected list of twelve neurologists:

Aminoacetic acid has been accepted since 1935 for inclusion in New and Nonofficial Remedies and described as outlined in the enclosed tear sheets.

The Council members have voted to reconsider this product and suggested that the Secretary get in touch with outstanding neurologists. Accordingly we are taking the liberty of asking if you would care to make any comments on the present status of aminoacetic acid in your respective field. These comments will be presented to the Council members to help them in their reconsideration of whether or not aminoacetic acid should be retained in New and Nonofficial Remedies.

It is hoped that this request does not prove too great an imposition on your time.

Of this list nine replies were received. For the sake of record the replies are reproduced without the names of the consultants.

#### First Consultant

I have given up its use entirely. I have given the drug a good trial in myasthenia gravis, progressive muscular atrophy, amyotrophic lateral sclerosis and in various forms and stages of muscular dystrophy without observing any lasting benefits.

#### Second Consultant

I used a great deal of it some years ago in cases of myasthenia gravis and muscular atrophy without any appreciable effect. I have not used it for several years and probably never shall.

#### Third Consultant

I have had very little experience with this compound. I have used it in progressive muscular dystrophy but have never seen anything I thought very advantageous from its use. Recently I have not made use of it at all.

#### Fourth Consultant

I have seen no clinical improvement from its use.

#### Fifth Consultant

I used it extensively for a selected group of patients with progressive muscular dystrophy for over a year. Results were uniformly disappointing with no evidence of improvement in any of the patients. I feel it has no place in the treatment of muscular or neural disorders.

#### Sixth Consultant

My experience has been that this substance is of no practical value in the treatment of the muscular atrophies or dystrophies. My experience is somewhat limited and must be judged on this basis.

#### Seventh Consultant

In 1939 H. R. Viets and R. S. Schwab (*The Diagnosis and Treatment of Myasthenia Gravis*, THE JOURNAL, Aug. 12, 1939, p. 559) wrote as follows: 'Aminoacetic acid, contrary to our expectations from Boothby's reports, proved to be of no value in 17 cases. As much as 45 Gm. a day in divided doses, a larger amount than Boothby recommended was given. This consultant is aware that, with the additional experience of two years, these men would not care to change the statement except to add more cases.'

#### Eighth Consultant

It has seemed to me that its use in large doses helped to delay progressive atrophy. I have no proof, this is only a clinical impression gained from 5 or 6 cases.

#### Ninth Consultant

I have not been using aminoacetic acid in recent years and my earlier experience was limited to a few cases of asthenia of doubtful type. In those instances the creatine excretion was diminished under glycine administration but the experiments were not conclusive because other measures such as psychotherapy were also employed and I have seen more striking improvement in comparable cases without glycine.

In *Biochemistry of Disease* the Bodanskys reviewed the literature on this subject. They state: 'Glycine has been recommended as a therapeutic agent in progressive muscular dystrophy by a considerable number of clinicians. The reports concerning its therapeutic value are however very conflicting. A few have described definite improvement but the majority of reports deny that amino acid is of any definite value.'

After consideration of the comments of the neurologists consulted a letter of inquiry was sent to the manufacturers of accepted brands of aminoacetic acid asking that they forward any available evidence to warrant continued inclusion of this agent in New and Nonofficial Remedies. From the replies received from these firms there is no indication of evidence for the usefulness of this drug that would justify its retention.

In view of the foregoing the Council voted to omit Aminoacetic Acid and the accepted brands from New and Nonofficial Remedies.

## NEWER KNOWLEDGE OF THE MECHANISM OF TUBERCULOSIS IMMUNITY

The exceedingly ingenious tissue transplantation techniques reported by Lurie and Zappasodi<sup>1</sup> of the Henry Phipps Institute, University of Pennsylvania, have added materially to current knowledge of the intracellular or nonhumoral factors in acquired immunity to tuberculosis. Early failures to produce an effective antituberculosis serum led to the conclusion that acquired immunity to this disease is a much more complex process than the simple antitoxic immunity against diphtheria infection. An elaborate theory of "partial antibodies" was formulated by Deycke and Much<sup>2</sup> to explain this complexity. According to this theory, acquired antituberculosis immunity is due to the formation of four distinct groups of partial antibodies. Three of these are assumed to exist in the blood stream, while the fourth is found only in the cytoplasm of fixed tissue cells. This theory was partially confirmed by American investigators,<sup>3</sup> who found that the acquired power of prompt intraperitoneal lysis of the tubercle bacillus cannot be transferred serologically even by repeated massive blood transfusions from tuberculoimmune donors. Isolated peritoneal tissues from these immune donors were found to have the power of lysing tubercle bacilli in vitro. Lysis did not occur in control tests with normal peritoneal tissues even when suspended in tuberculoimmune serum.

The essential bacteriostatic factor in immune fixed tissue cells has been studied in greater detail by Lurie<sup>4</sup> and his collaborators of the University of Pennsylvania. They have shown that the dominant defensive cells in acquired immunity to tuberculin are the mononuclear phagocytes. These show heightened physiologic activities in tuberculous animals, expressed by an increased rate of cell division and by increased phagocytosis of

india ink, pyogenic cocci and other particulate matter. Not only are tubercle bacilli taken up more rapidly in immune macrophages but the ingested bacilli fail to multiply within the body of the phagocytes, abundant intracellular proliferation taking place in control tests with nonimmune macrophages.

Numerous unsuccessful attempts have been made to determine the mechanism of this intracellular growth inhibition by in vitro studies of leukocytes<sup>5</sup> and fixed tissue cells<sup>6</sup>. These have usually given inconclusive results, owing to the difficulty of maintaining such cells at full physiologic vigor for sufficient periods of time outside the animal body. To avoid this difficulty Lurie attempted the same analysis by tissue transplantation methods, the anterior chamber of the eye being the selected transplantation site. The anterior chamber of the eye serves as an almost perfect medium<sup>7</sup> for the cultivation of homologous normal and pathologic tissue cells.

Normal and immunized rabbits were given subcutaneous injections of human or bovine tubercle bacilli suspended in salt solution containing india ink. The regional lymph nodes were removed two days later. These glands were cut into fine particles and repeatedly washed in Tyrode solution, and several particles were introduced into the anterior chamber of the eye of an albino rabbit. Immune tissue fragments were introduced into one eye, and control nonimmune fragments in the opposite eye of the same animal. Samples of the same tissues were used for control bacteriologic and microscopic study. Similar implantations were made with immune and nonimmune bone marrows from rabbits injected intravenously two days previously with tubercle-carbon suspensions.

Growth of the implants was observed for ten to fourteen days. At the end of this time the rabbits were killed and the implanted cells studied both microscopically and by quantitative culture methods. In a typical experiment the number of colonies cultured from 100 mg of implanted normal cells was forty times the number of bacilli originally present in these cells. In parallel tests with immune tissues there was only a fourfold increase in bacterial count. In all cases the cells of immune rabbits that had ingested tubercle bacilli in vivo and had grown in the anterior chamber of normal rabbits had greatly inhibited the normal multiplication of ingested tubercle bacilli.

This technic, of course, did not rule out the possible bacteriostatic role of humoral antibodies adherent to the injected bacteria. Implantations into the anterior chambers of normal rabbits were therefore made of

washed (serum free) normal and immune macrophages that had taken up tubercle bacilli in vitro. These cells were obtained from normal or immune rabbits which had received intrapleural injections of acacia solution four or five days previously.<sup>8</sup> The experiments showed that there is no appreciable increase in phagocytosis by normal macrophages when the ingestion occurs in the presence of immune serum, compared with control tests in normal serum. There was also no acquired power of bacteriostasis as a result of such exposure to immune serum. Cells obtained from immunized animals and washed free from immune body fluids were more actively phagocytes in the presence of normal serum and inhibited subsequent intracellular proliferation of the ingested bacilli ten times more effectively than did normal macrophages similarly tested.

From a multiplicity of data of this type Lurie concludes that active tuberculosis confers increased bacteriostatic properties for ingested tubercle bacilli on fixed tissue phagocytes and that this acquired immunity is independent of circulating antibodies. Demonstration of this fixed tissue bacteriostaticity has clinical interest in numerous other infectious diseases particularly virus infections, in which available evidence suggests the relative unimportance of so-called circulating antibodies. Whether or not the intracellular bacteriostat can be extracted from tuberculoimmune macrophages has not yet been determined.

#### FEEBLEMINDEDNESS AND HEREDITY

The story of a feeble-minded family given the pseudonym 'Kallikak' was published in 1912 by Goddard. Sociologists, psychologists and geneticists varied widely in their acceptance of his conclusions. In 1925 Dr Abraham Myerson in a book entitled "The Inheritance of Mental Disease" took sharp issue with Goddard's conclusions. This was appropriate and fortunate for the science of human genetics. Unfortunately the book also contained some misstatements regarding Goddard's study. Others have misinterpreted some of his conclusions.

Like all authors, Professor Goddard objects to being misquoted and misinterpreted. In his recent article in *Science* he<sup>1</sup> points out some of the misquotations and some of the misinterpretations which have appeared in the literature. Two questions which naturally arise in connection with this reopening of a discussion of the Kallikak study are: By what criteria should this study be judged? and How closely do the conclusions which are drawn by the author agree with present opinion? These are not easy questions to answer because the whole subject concerned is still in a controversial state.

In terms of present day requirements for an analysis of the relative roles of heredity and environment in the determination of the variability observed in a mental character, the Kallikak study falls far short in rigor and in analytic technic. It makes use neither of refined psychologic tests nor of detailed statistical methods. However, it must be viewed in the light of the psychologic and genetic knowledge of 1914. When thus considered, it compares favorably with studies in other sciences at similar stages of development.

As regards the agreement between the conclusions drawn by Goddard in his book published in 1914 and present opinion, there is nothing definite which can be said. However, a few comparisons can be made. In chapter VIII of "Feeble-mindedness: Its Causes and Consequences," Goddard leaves the impression that he considers intelligence a unitary character. This point of view is certainly indefensible today, and probably Professor Goddard would not even want to defend this thesis now. Feeble-mindedness is not even considered a unit character by modern investigators. Many types and degrees of it are recognized. In the same chapter the author argues for the inheritance of feeble-mindedness as a simple recessive. This conclusion may not be far from the truth for certain types of feeble-mindedness. There exists at least considerable evidence that certain types are inherited in a relatively simple fashion and that some of the responsible genes behave as recessives. Other types give evidence of being due to genes inherited as dominants.

In summarizing present opinion regarding the relative roles of heredity and environment in the determination of feeble-mindedness, the following statements seem pertinent. 1 Feeble-mindedness is a general name for low mentality and is not a unitary character. There are many types and degrees of it. 2 Some types of feeble-mindedness are the result of variations in the environment: birth injury, lack of iodine, infectious diseases, unfavorable cultural conditions, and the like. 3 Some types of feeble-mindedness are the result of variations in hereditary factors. Whether a variation in a single genetic locus may be responsible for feeble-mindedness is as yet uncertain, but certain types appear to involve variations in only one or at least in only a limited number of loci. 4 Some types may be the result of a combination of unfavorable environmental and hereditary factors. 5 Of the hereditary types of feeble-mindedness which have been reported, some give evidence of being due to a single recessive gene or to a limited number of recessive genes. A few appear to be inherited in a dominant fashion. A few studies suggest a role played by sex-linked genes. 6 Improvement in the performance of all feeble-minded individuals may be expected by improving environmental conditions. However, at least for the types which have a

<sup>1</sup> Goddard Henry H. In Defense of the Kallikak Study. *Science* 95: 574 (June 5) 1942.

hereditary basis, there appears to be a definite limitation of the extent to which improvement may be expected.

Whatever the final conclusions concerning the merits of the original Kallikak study, it can be recognized that Goddard gave an enormous stimulus to scientific investigation of inheritance of feeble-mindedness and indeed to the entire science of human genetics.

### Current Comment

#### REPORTS OF THE COUNCIL ON PHARMACY AND CHEMISTRY

The Council on Pharmacy and Chemistry recently issued the thirty-third edition of the Annual Reprint of the Reports of the Council on Pharmacy and Chemistry of the American Medical Association.<sup>1</sup> This volume contains in compact form not only the reports of the Council which have been published in *The Journal* during the past year but also some additional reports which were not considered of sufficient importance to be published in *The Journal*. The reports may be divided into four classes: reports rejecting products as not being acceptable for inclusion in New and Nonofficial Remedies, reports omitting from New and Nonofficial Remedies products that have previously been accepted, reports on the nomenclature of various substances and reports in which the Council gives decisions of general interest or summarizes the latest scientific knowledge concerning certain topics. The last classification includes the largest number of reports. One article deals with the developments in bacteriophage therapy since the previous report of the Council in 1934. Other reports bring to the present day the status of such products as aluminum hydroxide preparations, antipneumococcal serums, cyclopropane, human blood plasma and serum, human convalescent poliomyelitis serum, human convalescent mumps serum and sulfadiazine. Such topics as ion transfer (iontophoresis), halogenated vegetable oils for bronchography and the problem of lipid pneumonia and the sympathomimetic amines as epinephrine substitutes are discussed. The nomenclature reports deal for the most part with the Council's adoption of nonproprietary designations for comparatively new products such as diethylstilbestrol, menadione and sulfadiazine. Explanations are given for the omission at this time of products which have previously been included in New and Nonofficial Remedies. In most cases the N. N. R. description is included in the report as a matter of record. The volume also includes the reports rejecting various products—which have either been submitted by the manufacturer or considered on the Council's own initiative—and which have been found not acceptable for inclusion in New and Nonofficial Remedies. Also incorporated is a brief summary of the decisions arrived at by the Council at its latest meeting.

#### RESEARCH IN CANCER AT THE MEMORIAL HOSPITAL

The Biennial Report of the Memorial Hospital for the Treatment of Cancer and Allied Diseases in New York, just available,<sup>1</sup> indicates the contribution which this institution is making in research. Investigations have been carried forward by means of animal experiments, chemical studies, examinations of the role of diet in cancer, by study of cancer in man, search for cancer producing substances, by attempts to starve the cancer cells and in problems of leukemia and the vitamins. An additional group of studies is in progress in an attempt to short-circuit the more prolonged investigations and to develop a method of cure without a knowledge of the mechanisms by which the cure would be effected. This is a purely empiric study, involving experiments which so far have employed some seventy different compounds for their effect in killing cancer cells. The results already secured may have far reaching significance. The chemicals which appear to have an anticancer effect are characterized by a common structure. They prove apparently that there is a real difference between cancer cells and normal cells in their sensitivity to certain types of chemicals.

#### INSTITUTES ON WARTIME INDUSTRIAL HEALTH

California has become one of our foremost industrial states. Inevitably physicians will be required to meet vastly expanded demands for industrial health service. A series of wartime industrial health institutes is now being offered in such strategically located industrial areas as San Francisco, Crockett, Oakland, San Diego, Inglewood, Glendale and Huntington Park. These meetings have been developed by the California State Department of Health in cooperation with the California Medical Association and the Western Association of Industrial Physicians and Surgeons. The programs are designed to present concisely and practically the important clinical, administrative and socioeconomic problems which a physician is likely to encounter in his first engagements with industry and to dramatize as well the agencies for consultation and assistance which are already at his command. Naturally the concept of health in relation to expanded wartime production is featured. Outside of military service the most important contribution that a physician can make to the war effort lies in the direction of industrial health. This current educational activity in California and in a few other states is substantial recognition that something beyond simple acknowledgment of the importance of improved physical welfare of workers is necessary. These institutes on industrial health are highly desirable as introductory instruction both to physicians and to industrialists. They should be followed by suitable provision for more extended postgraduate study using resources of medical schools, industrial hygiene laboratories, well conducted industrial medical services and other agencies under stimulation and leadership of active committees on industrial health in state and county medical societies.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army Navy and Public Health Service and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## CONFERENCE ON VENEREAL DISEASE CONTROL IN WARTIME

Veneral disease and the war effort will be discussed at a conference in Hot Springs National Park Ark. October 21-24 held under the auspices of the United States Public Health Service in conjunction with the eighth annual meeting of the American Neisserian Medical Society. Surg. Gen. Thomas Parran will preside. State and local health officers, veneral disease control officers, practicing physicians and all others engaged in veneral disease control activities are urged to attend. The governmental professional and health organizations to be represented at the conference will include the War Department, the Navy Department, the Office of Defense Health and Welfare Services, the American Medical Association, the American Neisserian Medical Society, the American Social Hygiene Association, state and local health departments and the United States Public Health Service. A tentative program of the conference follows:

OCTOBER 22 10 A M

### VENEREAL DISEASE CONTROL MEASURES INFLUENCING THE WAR EFFORT

1. Rehabilitation of Selectees with Syphilis and Gonorrhea. Lieut. Col. Richard H. Eanes, Assistant Director, Medical Division, Selective Service System.
2. Present Veneral Disease and Prostitution Problems as They Relate to the Army. Lieut. Col. T. B. Turner, Director, Veneral Disease Control Division, Preventive Medicine Service, United States Army.
3. Present Veneral Disease and Prostitution Problems as They Relate to the Navy. Capt. C. S. Stephenson, in Charge, Division of Preventive Medicine, Bureau of Medicine and Surgery, United States Navy.
4. The Contribution to the War Effort of the Subcommittee on Venereal Diseases, National Research Council. Dr. J. E. Moore, Baltimore.
5. Private Physician Support of the Wartime Veneral Disease Control Program.

OCTOBER 22 2 P M

### THE EPIDEMIOLOGY OF SYPHILIS AND GONORRHEA 1942

1. The Epidemiology of Gonorrhea as a Stimulus to Prostitution Repression. Dr. Donald H. Williams, Medical Director, Division of Veneral Disease Control, Provincial Board of Health, Vancouver, B. C.
2. Improvement of Present Methods for Extrafamilial Contact Tracing. Miss Mary A. Burke, Consultant in Social Hygiene Nursing, Detroit, Department of Health.
3. Difficulties in Case Holding of Selectees Infected with Syphilis. Dr. G. Ford McGinnis, Director, Division of Veneral Disease Control, Tennessee State Department of Health.
4. Defects in the Present Follow-Up Program. Lida J. Usilton, Principal Statistician, Division of Veneral Diseases, U. S. Public Health Service.
5. The Male Investigator in Veneral Disease Control Follow-Up. Dr. Malcolm H. Merrill, Chief, Bureau of Veneral Diseases, California Department of Public Health.

OCTOBER 23 9 30 A M

### EIGHTH ANNUAL MEETING AMERICAN NEISSERIAN MEDICAL SOCIETY

1. The Control of Veneral Disease Among Industrial Workers. Surg. Onis L. Anderson, Assistant Chief, Division of Veneral Diseases, U. S. Public Health Service.
2. Organization and Management of Clinics in a State Gonorrhea Control Program. Dr. F. W. Caudill and Dr. R. E. Teague, Kentucky State Department of Health.
3. Gonococcus Culture Methods. Dr. Charles M. Carpenter, School of Medicine, University of Rochester.

4. Management of Gonorrhea in the Male. Dr. P. S. Pelouze, University of Pennsylvania, Philadelphia.
  5. Management of Gonorrhea in the Female. Dr. Robert M. Lewis, Yale University School of Medicine.
  6. Hyperpyrexia in Chemoreistant Gonorrhea. Dr. Stanford L. Warren, School of Medicine, University of Rochester.
- General discussion led by Dr. Nels A. Nelson, Director, Division of Veneral Disease Control, Maryland Department of Health, and Dr. Adolph Jacobs, New York City Health Department.

OCTOBER 23 2 P M

### EIGHTH ANNUAL MEETING AMERICAN NEISSERIAN MEDICAL SOCIETY

1. Gonococcus Culture as a Public Health Service. A Preliminary Report. Capt. Daniel Burman, Veneral Disease Control Officer, Headquarters, First Army, Governors Island, N. Y.
2. President's Address. Asst. Surg. Gen. R. A. Vonderlehr, Division of Veneral Disease, U. S. Public Health Service.
3. Gonorrhea from the Standpoint of the Army. Capt. Ernest B. Howard, Veneral Disease Control Officer, Fourth Army Corps Area, Manila, C. I.
4. Gonorrhea from the Standpoint of the Navy. Capt. C. S. Stephenson, Division of Preventive Medicine, Bureau of Medicine and Surgery, United States Navy.
5. Review of the Year's Research in Gonorrhea. Dr. Alfred Cohn, Department of Health, New York City.
6. Role of Organized Medicine in the Control of Gonorrhea. Dr. Robert S. Breakley, Lausaug, Mich.

OCTOBER 23 2 P M

Demonstration: Techniques of Modern Serodagnostic Tests for Syphilis

OCTOBER 24, 9 30 A M

### WARTIME VENEREAL DISEASE CONTROL EDUCATION PROGRAM

1. Relationship Between the Programs of Veneral Disease Control Education and the Repression of Prostitution.
  - (a) From the point of view of public health. Dr. George M. Leiby, Director, Division of Preventive Medicine, Louisiana State Department of Health.
  - (b) From the point of view of social protection. Mr. Charles P. Taft, Assistant Director, Office of Defense Health and Welfare Services.
  - (c) From the point of view of the public. Mr. Capus Waynick, Director, Demonstration of Public Health Education Measures in the Control of Veneral Diseases, Raleigh, N. C.
2. Veneral Disease Control Education Program in the Armed Forces.
  - (a) Army. Major William A. Brumfield, Veneral Disease Control Division, Preventive Medicine Service, U. S. Army.
  - (b) Navy. Capt. C. S. Stephenson, U. S. Navy.
3. Current Status of Veneral Disease Education. Surg. Gen. Thomas Parran, U. S. Public Health Service.

OCTOBER 24, 2 P M

### RESEARCH INFLUENCING THE WARTIME VENEREAL DISEASE CONTROL PROGRAM

1. Progress in Investigations of the Intensive Therapy of Syphilis. P. A. Surgeon Harry Eagle, U. S. Public Health Service Syphilis Research Center, Baltimore.
2. New Serologic Tests for Syphilis and Their Demonstrated Efficiency. Dr. Arthur H. Santford, Mayo Clinic, Rochester, Minn.
3. Progress in the Wartime Management of Gonorrhea. Dr. P. S. Pelouze, University of Pennsylvania, Philadelphia.
4. Relationship Between Veneral Disease Control and the Joint Army and Navy Committee on Welfare and Recreation. Brig. Gen. F. H. Osborn, Chief of Special Service, United States Army.
5. Problems Involved in the Adaptation of Recent Scientific Discoveries to the Wartime Control of the Veneral Diseases. Dr. John H. Stokes, University of Pennsylvania, Philadelphia.

OCTOBER 21, 2 P. M.

### TECHNIQUES OF VENEREAL DISEASE EDUCATION

1. Introductory comments. Asst. Surg. Gen. R. A. Vanderlehr, U. S. Public Health Service.  
Presentation of a Typical Venereal Disease Education Problem for Discussion by Panel and Conference.  
Discussion Leaders:  
State Health Officer. Dr. Felix J. Underwood. Executive Officer, State Board of Health, Jackson, Miss.  
State Venereal Disease Control Officer. Dr. Malcolm H. Merrill. Chief, Bureau of Venereal Disease, Department of Health, San Francisco.  
Local Health Officer. Dr. Hugh Leavelle. City Health Officer, Louisville, Ky.  
Local Venereal Disease Control Officer. Dr. F. W. Shaffer. Director, Social Hygiene Division, Department of Health, Detroit.  
Community Resources. Dr. Lucy Maryin. Health Education Consultant, P. H. S. Community Organization for Health Education, Fayetteville, N. C.

- Voluntary Health Agency. Dr. William F. Snow, Director, American Social Hygiene Association.  
Health Department Public Relations. Miss Ann Wilson Haynes, Public Information Editor, Department of Public Health, San Francisco.  
Crime Management. Dr. Nels A. Nelson, Director, Division of Venereal Disease Control, State Department of Health, Baltimore.  
Gonorrhea. Dr. Charles M. Carpenter, School of Medicine, University of Rochester.  
Syphilis Case Control. Miss Anne Swancy, Vanderbilt University Hospital, Nashville, Tenn.  
Gonorrhea Case Control. Mr. Morris S. Wortman, University of Missouri, Columbia, Mo.  
Social Protection. Mr. Arthur F. Fink, Regional Supervisor, Division of Social Protection, Birmingham, Ala.  
Work Projects Administration. Mr. T. Lefoy Richman, Informational Specialist, U. S. Public Health Service.  
Nursing. Miss Donna Pearce, Public Health Nursing Consultant, U. S. Public Health Service.  
General Health Education. Miss Elizabeth Bohnenberger, Director of Health Education, State Board of Health, Jacksonville, Fla.

### RESTRICT SALE OF ALL QUININE

The Health Supplies Branch of the War Production Board called attention August 17 to the fact that all stocks of quinine and totaquine, no matter how small, have been subject to the restrictions of Conservation Order M-131 since June 19.

Prior to that date, stocks of 50 ounces or less could be freely sold. Since June 19, retail druggists and all other sellers have not been permitted to sell quinine or totaquine for any purpose except as an antimalarial agent. The order extends to powder, capsules, solutions, pills and tablets and to quinine or totaquine stocks of all other descriptions whether or not packages have been opened.

The same sales restrictions apply to cinchonine, cinchonidine and quinidine, which are covered by Order M-131-a. No stocks of these may be sold except as an antimalarial agent and, in the case of quinidine, for the treatment of cardiac disorders.

The branch stresses that these drugs are urgently needed for military antimalarial use. Supplies are limited since their raw material source, cinchona bark, comes in most part from Java.

Druggists and pharmaceutical and proprietary manufacturers may not use their stocks of quinine or other alkaloids of cinchona bark in the manufacture of products which are designed for other than permitted purposes. These restrictions extend as well to dispensing of the drugs on physicians' prescriptions.

The practical effect of these regulations as far as manufacturers are concerned is to prohibit the use of their stocks in the manufacture of products such as elixir of iron, quinine and strychnine phosphates, coryza tablets and other formulas designed for treatment of other than malarial ailments. However, any such products which were manufactured prior to the effective date of the order controlling the particular drug involved may be sold without restriction.

Druggists having stocks of quinine, cinchonine, cinchonidine and quinidine in excess of their requirements for the permitted uses are urged to return the drugs to their source of supply.

### OPINION ON USE OF CINCHONA AND CINCHONA ALKALOIDS FOR THE TREATMENT OF MALARIA

The following notice is from the Food and Drug Administration, Washington, D. C.

As a guide to its activities under the provisions of the Federal Food, Drug and Cosmetic Act in the consideration of preparations offered for the treatment of malaria, the Food and Drug Administration requested an expression of opinion from the National Research Council as to the use of the cinchona alkaloids in this field. The request was referred by the Council to its Division of Medical Sciences, Subcommittee on Tropical Diseases. We are now in receipt of a report from the National Research Council in which it states that a preparation of one or more of the crystallizable cinchona alkaloids (quinine, quinidine, cinchonine, cinchonidine) for the treatment of malaria

should provide daily for seven consecutive days, for adults, at least 20 grains of the alkaloid or alkaloids.

The minimum amounts of these alkaloids which should be provided daily for the same period for children are as follows:

| Age          | Grains | Age               | Grains |
|--------------|--------|-------------------|--------|
| Under 1 year | 2½     | 7 to 8 years      | 12½    |
| 1 to 2 years | 5      | 9 to 10 years     | 15     |
| 3 to 4 years | 7½     | 11 to 12 years    | 17½    |
| 5 to 6 years | 10     | 13 years and over | 20     |

It is the understanding of this administration that the reference to "cinchona alkaloids" includes the commonly used salts of these alkaloids.

The Council states that in making this recommendation it recognized that 20 grains of the cinchona alkaloids a day do not provide the optimum dose for adults—which should be 30 grains—but that the minimum of 20 grains is specified as a compromise to provide for an effective dose and to conserve the stocks of these alkaloids during the war period.

The Council has expressed the opinion also that the cinchona alkaloids are not effective in the prophylaxis of malaria.

In its enforcement program the Food and Drug Administration will be guided by this authoritative expression of opinion and will regard as misbranded preparations of cinchona alkaloids offered for the treatment of malaria which, when consumed in accordance with the directions in their labelings, provide less than the dosages specified.

The administration heretofore has expressed the opinion—and takes this occasion to emphasize it—that directions for use, to be adequate, should include instructions to repeat the treatment if a relapse occurs.

It has been noted that cinchona alkaloids and preparations of them are sometimes marketed in packages which do not contain amounts of the active principles sufficient to constitute a complete treatment in accordance with the aforementioned schedule. Consideration should be given to the possibility of deception, in violation of the Federal Food, Drug and Cosmetic Act, resulting from the sale of a package labeled to indicate that it contains a treatment for malaria, if the amount of medication supplied in the package is insufficient for that purpose.

Some preparations of the cinchona alkaloids offered as malaria medicines contain active amounts of cathartic drugs. There appears to be no rational basis for such a combination. Some patients suffering with malaria may not need a cathartic. Those who may need such additional medication should base the dosage on the need for it, in other words, the amount of the cathartic administered should not depend on the need for the cinchona alkaloids. There is no objection to advising purchasers to use some suitable cathartic drug in connection with the malaria treatment if constipation occurs.

This notice supersedes the press release of Jan. 3, 1929, entitled "Malaria Preparations Must Comply With Food and Drugs Act Say Federal Officials," issued by the Office of Information, United States Department of Agriculture.

W. G. CAMPBELL  
Commissioner of Food and Drugs

## RADIO BROADCAST ON SUPPLY OF PHYSICIANS

On Sunday August 10 from 11:05 to 11:30 a m. eastern time (10:05 to 10:30 central, 9:05 to 9:30 mountain, 8:05 to 8:30 Pacific time) the Columbia Broadcasting System will air a program entitled "The American Doctor Goes To War." Participants in that broadcast will be Dr. Frank H. Lahey, Chairman, Procurement and Assignment Service of the War Manpower Commission; Dr. Warren L. Draper, Acting Surgeon General, United States Public Health Service (Surgeon General Thomas Parran will be on his way to South America); Major Gen. James C. Mace, Surgeon General, United States Army; and Rear Admiral Ross T. McIntire, Surgeon General, United States Navy; and personal physician to President Roosevelt.

The representatives of the three services will state their needs, objectives and the current state of achievement toward those objectives—Army, Navy, civilian. Dr. Lahey will represent the point of view of the profession and of the War Manpower Commission in the recruitment and placement of physicians essential to all three fields.

The hour at which this broadcast will occur is a regular talk hour on the Columbia Broadcasting System and has a large station list and a well built up audience. This is the first time that the three services have appeared together on a program of this type. The discussion will not only include the problems of recruitment but provide background as to the type of service rendered in connection with the respective services—military and navy programs.

It is a program which will be of interest not only to doctors and their families but to every family with a relative in the armed services and to every industrial worker or civic leader who ever finds occasion to discuss this problem as a citizen.

## NAVY MEDICAL HEADQUARTERS MOVED

Over the August 14-17 weekend the Bureau of Medicine and Surgery, Navy Department, Washington, D. C. was moved from quarters it had occupied in the Navy Department building to the naval reservation a half mile westward on Constitution Avenue which formerly was the home of the Naval Medical Center. For the first time since outbreak of the war all divisions of the bureau are together on the same grounds it not under the same roof. The group of buildings once the Medical School, Dental School, Hospital and sick officers' quarters will be known collectively henceforward as Potomac Annex, Navy Department. Since last spring the National Naval Medical Center has occupied its modern new establishment at nearby Bethesda, Md.

## AVIATION PHYSIOLOGISTS

A class in aviation physiology graduated at the School of Aviation Medicine in Texas August 8 and another class began the course of training on August 10. Among those in the class graduated were Capt. Hayden C. Nicholson, Ann Arbor, Mich. and Lieuts. Halsey G. Bullen, Brooklyn and Richard L. Masland, Philadelphia of the medical department and a number of members of the Air Corps.

Among those in the class beginning August 10 were the following lieutenants of the medical department: Lewis E. Barrick, Chicago; Dale D. Dickson, Letts, Ind.; Vincent H. Handy, East Orange, N. J.; John M. McIver, Cleveland; and various officers of the Sanitary and Air Corps.

The course in aviation physiology treats of the effects of lowered barometric pressure on personnel, anoxia and the effect of flight on man, the operation of low pressure chambers, the theory and practical use of oxygen equipment and the conduct of high altitude indoctrination and classification.

## UNITED CHINA RELIEF COMMITTEE

The president of the Chicago Medical Society, Dr. Oscar Hawkinson, has appointed a committee to represent the medical profession in the Cook County Ill. campaign for the United China Relief. This committee comprising Drs. Frank P. Hammond, chairman, Wilbur E. Post, James G. Carr, George W. Post and James H. Hutton in appealing for funds points

out that doctors, nurses and medical technicians have been the backbone of the famous and unique "American Expeditionary Force in China" and have been credited with sustaining Chinese morale and defeating Japanese propaganda through five years of war in China. Money is desperately needed; it once the committee says. Checks should be made out to United China Relief, Inc. and mailed to this committee at the offices of the Chicago Medical Society, 30 North Michigan Avenue, Chicago.

## LOUISIANA UNIT TO GO ON FOREIGN SERVICE

The Louisiana State University Unit (General Hospital No. 64) which was mobilized for active duty in the army in July will be assigned to foreign duty, according to B. I. Burns, dean of the Louisiana State University School of Medicine, New Orleans. All medical members of the unit are on the faculty of the medical school; many of them were already on active duty when the unit was mobilized but have since joined the unit. The unit was organized in 1940 by Dr. Urban Maes, who served in France in the surgical section of Base Hospital No. 24 in the first world war. The present unit previous to mobilization was directed by Lieut. Col. Ben R. Henninger, clinical professor of medicine and now chief of the medical section of the unit. On mobilization Col. Daniel B. Faust of the regular Army Medical Corps was assigned to command. The chief of the surgical section is Lieut. Col. Charles J. Mingolatta, clinical assistant professor of surgery.

## AMERICAN RELIEF SUPPLIES ARRIVE IN RUSSIA

Russian War Relief, Inc. with headquarters at 11 East 35th Street, New York City, announced on August 9 that a radio-gram from Moscow authorities acknowledged receipt of four shipments of relief supplies sent by Americans. The shipments contained medical and surgical supplies, men's clothing, small kerosene stoves, cigarettes and other supplies. It was reported that the goods had been distributed to both the army and "the population which has suffered from the German invasion." The kerosene stoves it was said are most valuable for field hospitals. One of the shipments reported received was contributed during a recent "Fill the Ship" campaign for Russian War Relief in southern California.

## TWO DOCTORS APPOINTED FOR WAACS

The War Department recently announced the appointment of two on contract surgeons for the Women's Army Auxiliary Corps now stationed at Fort Des Moines, Iowa. They are Dr. Mary L. Moore of Rifle, Colo. and Dr. A. Elizabeth Garber of Chicago. Secretary of War Stimson said at a press conference recently that the WAACs eventually would have women doctors assigned to them full time but that while the corps is getting its full strength, appointments would be on a contract basis.

## MEDICAL OFFICER AT TRAINING SCHOOL

Lieutenant Commander Hubbard P. Saunders, president of the Chicago Medical Society, has been named the medical officer at the naval training school for electricians mates just opened on the campus of the Kentucky State Teachers College in Moorhead. He is one of the officers in charge of six hundred navy enlisted men who have been selected for special electrical training before they are sent to do sea service with the fleet. The new school is staffed with six officers.

## FLIGHT SURGEONS' ASSISTANTS

Graduation exercises were held for flight surgeons' assistants who completed the course of training at the School of Aviation Medicine, Randolph Field, Texas, August 1. Certificates were presented by Major Merrill J. Reeh, M. C. General courses for flight surgeons' assistants are conducted annually at the School of Aviation Medicine.

Lambert Pharmaceutical Co. of St. Louis, Mo., fellowship, have been established to provide graduate training in tropical medicine for young physicians who are citizens of the United States. Applications should be addressed to the dean of graduate studies, Tulane University, New Orleans. According to an announcement the exact names of the fellowships should not be altered since the phraseology in each instance has been designated by the donor.

### MARYLAND

**Dog Quarantine in Baltimore**—A quarantine on dogs was established by the state board of agriculture for northwest Baltimore and adjoining areas in Baltimore County, effective June 11 to September 11, following the discovery of rabies in dogs in the county near the city boundary. This is the first time that such an action has been taken in Baltimore. Until recently there had been no known rabid dogs in the Baltimore area since 1931.

**Dr. Colston Succeeds Dr. Hugh Young**—Dr. John A. C. Colston, since 1934 associate professor of urology at Johns Hopkins University School of Medicine, Baltimore, has been announced as the successor of Dr. Hugh H. Young as professor of urology at Johns Hopkins and is director of the Brady Urological Institute of Johns Hopkins Hospital. Dr. Young retired on June 30 with the title professor emeritus of urology. Dr. Colston was born in Baltimore in 1886, graduated at Johns Hopkins in 1911 and has been a member of the staff since 1915.

### MASSACHUSETTS

**Dr. Elkind Resigns from Mental Hygiene Society**—Dr. Henry B. Elkind, Boston, has resigned as medical director of the Massachusetts Society for Mental Hygiene, effective August 12, to enter active service in the medical corps of the army. Dr. Elkind has been medical director of the society since 1925.

### MICHIGAN

**Government Buys Battle Creek Sanitarium**—The Battle Creek Sanitarium has been turned over to the government and will in the future be known as the Percy L. Jones General Hospital for war casualties. The purchase price was more than two million dollars. Col. Norman F. Kirk, M. C., U. S. Army, will head the hospital. The first patients will arrive about October 1 from military training centers where they have contracted ailments requiring long treatment. The former patients of the sanitarium have been transferred to several nearby buildings to continue treatment under the general direction of Dr. John H. Kellogg of Battle Creek, it was announced.

**Clinic Awards Prizes for Essays**—The first prize of \$100 in the essay contest at the North End Clinic, Detroit, was won by Dr. Jerome Mark, Detroit, whose subject was "Venography: A Its Use in the Differential Diagnosis of the Peripheral Venous Circulation. B A Simplified Technique." Second prize of \$75 went to Dr. Aaron A. Farbman, Detroit, for his paper on "The Effect of Estrogenic Hormone on Hypertthyroidism." Honorable mention was given to Dr. Ezra Lipkin, Detroit, for his paper on "Brachial Plexus Block in the Treatment of the Painful Shoulder—A Review of Fifty Cases." The contest is held to promote the study of end results in the treatment of cases at North End Clinic and to encourage clinical and experimental research.

### NEW JERSEY

**Outbreak of Poliomyelitis**—Two deaths have occurred among 11 cases of infantile paralysis in Elizabeth, according to the *New York Times*, August 4. The 11 cases had been reported to the state department of health since July 1.

**Health Board Abolishes Eye Clinic**—On June 23 the Clifton Board of Health voted unanimously to abolish the eye clinic of the board as a measure of economy. The clinic has been under attack repeatedly by the committee for the control of blindness of the Passaic County Medical Society because it was directed by an optometrist and not a licensed physician. According to the Bulletin of the Passaic County Medical Society, Clifton school physicians refused to refer school children to the clinic and the attendance dropped sharply.

**Society News**—Dr. Leon Herman, Philadelphia, addressed the Cumberland County Medical Society, June 9, at Bridgeton, on "Difficulties Encountered in the Interpretation of Genitourinary Symptoms."—Dr. George T. Pack, New York, discussed "Early Diagnosis and Management of Carcinoma of the

Stomach" before the Bergen County Medical Society recently in Bergen Pines.—The Gloucester County Medical Society was addressed in Woodbury recently by Dr. Herbert T. Kelly, Philadelphia, on "Nutrition as It Applies to General Disease."

### NEW YORK

**Food Poisoning from Cream Pie**—Twenty employees of an upstate industrial plant were reported ill with food poisoning in an outbreak traced to contaminated cream pie. The illness was characterized by nausea, vomiting and diarrhea. Some of the patients experienced profuse sweating, abdominal pain, bloody stools and shock. The onset was sudden, with recovery from acute effects within twenty-four to forty-eight hours. There were no fatalities. According to *Health News*, all twenty employees had eaten the last meal prior to the development of the illness at the plant cafeteria. Cream meringue pie was the one food that was consumed by all the patients. The first person who became ill ate a portion of the pie about 5:30 p. m. on June 12 and had onset of symptoms about 9 o'clock that evening. Those who partook of the pie later had a shorter incubation period and those that ate it at 3 a. m. on June 13 became ill within two hours. Examination of the pie demonstrated heavy contamination of both the cream filling and the meringue with *Staphylococcus aureus*. The pies were prepared about midnight, June 11-12, and were about 18 hours old when the first patient was served. It was definitely established that no food handler in the kitchen was ill but that contamination was caused by unsanitary cleaning practices.

### New York City

**New Secretary of Board of Health**—Dr. Frank A. Calderone, instructor in preventive medicine at the New York University College of Medicine, has been appointed secretary of the New York City Department of Health to succeed Goodline Livingston Jr., who has resigned for war duty. Dr. Calderone graduated at New York University in 1924 and since 1938 has been serving as district health officer of the lower east side.

**Proposed Program to Rehabilitate Blind**—The New York Association for the Blind recently presented to government authorities for consideration a plan for the rehabilitation for war blinded. The plan would seek to reach the blind service man at the hospital bedside and follow through with a program of readjustment. The New York Association for the Blind recommended the creation of a division for the blind in the U. S. Employment Service.

### OHIO

**Opposition to Insurance Plans Set Up**—Newspapers have announced that an organization has been set up in Cleveland to develop opposition to medical service insurance plans in the community. The group will be known as the Association for Preservation of the Present American System of Medical Practice. Officers during the organization period include Drs. Carl L. McDonald and Theron S. Jackson, co-chairmen, Dr. John Robert Andrews, vice chairman, Dr. David M. Keating, secretary, and Dr. Max B. Laven, treasurer, all of Cleveland. According to the *Cleveland News* the association has as its only purpose the defeat of the proposed medical plan of insurance and favors the freezing of medical practice in its present status until after the war. Creation of this group followed the recent organization of the Cleveland Medical Service Association, which is a cooperative project of certain members of the Academy of Medicine of Cleveland.

### PENNSYLVANIA

**Society News**—The Reading Eye, Ear, Nose and Throat Society was addressed by Dr. Nevin H. Rupp, Reading, July 15, on "Eye, Ear, Nose and Throat Aspects of Chemical Warfare."—Dr. James O. Wallace, Pittsburgh, discussed "Management of Infantile Paralysis" before the Cambria County Medical Society in Johnstown, July 9.

### Philadelphia

**Health Commissioner Visits England**—Dr. Hubley R. Owen, director of public health, recently went to England "to make a first hand observation in the fields of civilian defense and public health in wartime," newspapers report.

**Changes at University of Pennsylvania**—Dr. Paul C. Colonna, director of orthopedics of the State University and Crippled Children's Hospital, and professor of orthopedic surgery of the University of Oklahoma School of Medicine Okla-

homa City has been appointed professor of orthopedic surgery at the University of Pennsylvania School of Medicine. Other changes on the faculty include the appointment of Harry I. Morton, Sc.D., to associate professor of bacteriology, Dr. Dale R. Coman to assistant professor of pathology, Richard G. Moll, Ph.D., to assistant professor of anatomy, Dr. Oscar A. Patson to professor of anatomy in the Graduate School of Medicine, and assistant professor of otolaryngology in the school of medicine, and Dr. Harriett Elizabeth Glenn Raydon to assistant to the dean school of medicine.

**Cancer Council Sponsors Program for Teachers**—The Philadelphia Cancer Council has arranged a program for high school science teachers at the Philadelphia County Medical Society, October 20 aimed to show how a special subject in this instance cancer, can be used to tie together physics, mathematics, chemistry, biology, and the other science subjects that are taught in high schools. The program will open with Dr. William Bates president of the Philadelphia County Medical Society, presiding, and speakers will be Dr. Stanley P. Reimann, chairman of the cancer commission of the state medical society on Use of a Correlating Subject in Science Teaching and Oscar Riddle, Ph.D. department of genetics, Carnegie Institution Cold Spring Harbor, N. Y. Biology In and Not In the High School. Robert W. Kunz, president of the Science Teachers Association will close the discussion.

### TENNESSEE

**Radiologists Elect Officers**—Dr. Horace D. Gray, Memphis was elected president during the recent annual meeting of the Tennessee Radiological Society in Memphis. Other officers are Drs. Franklin B. Bogart, Chattanooga vice president and John Marsh, Jr., Chattanooga secretary treasurer.

**Changes in Health Personnel**—Dr. Francis H. Cole, Nashville has been placed in charge of the division of tuberculosis control of the Memphis and Shelby County Health Department effective July 1. He succeeds Dr. Felix A. Hughes, Jr., Memphis who has been assigned to take charge of Lynnhurst Sanatorium, Oakville.

**New Medical Officer at Marine Hospital**—Dr. Anthony P. Rubino, formerly of Key West Fla. of the U. S. Public Health Service, has been appointed medical officer in charge of the United States Marine Hospital Memphis. He succeeds Dr. Edwin H. Carnes who was transferred to Alaska. Dr. Rubino has been a member of the public health service since 1926.

### WEST VIRGINIA

**State Society Approves Sickness Insurance**—The West Virginia State Medical Association at its annual session in July went on record as approving the principle of voluntary insurance to pay sickness costs. The action was the culmination of a four year period of study of the subject. It was recommended, however that for the present there be held in abeyance the adoption of any statewide plan and support rather the development of medical service plans in local communities having common and similar problems. It was further recommended that 'each plan shall provide for a schedule for medical fees at least equivalent to the minimum professional fee schedule adopted by the county medical society in the county or counties in which the plan is organized.'

### WISCONSIN

**Dr. Urben Made Director of Mental Hygiene**—Dr. Walter J. Urben, senior physician at the Mendota State Hospital, Mendota has been appointed director of the state division of mental hygiene, filling the vacancy caused by the death of Dr. Gilbert E. Seaman, Madison May 25, 1941. Dr. Urben graduated at the University of Wisconsin Medical School, Madison in 1930. Before joining the Mendota staff, Dr. Urben was assistant superintendent of the Massillon State Hospital in Ohio, senior physician at the Southern Wisconsin Colony and Training School, Union Grove and staff physician at the Milwaukee County Hospital for Mental Diseases.

**Borden Prize Awarded to Chemist**—Hugo H. Sommer, Ph.D., professor of dairy industry, University of Wisconsin, Madison was presented with the Borden prize of the American Dairy Science Association at its recent annual meeting. The prize consists of a gold medal and \$1,000. Dr. Sommer received his degree or doctor of philosophy at Wisconsin in 1922. For a time he was chemist of the North California Milk Producers Association joining the University of Wisconsin in 1920. His work covered various aspects of dairy chemistry, including the

study of the acidity of milk, milk grading, solubility of metals in milk and the curd strength and renet coagulation of milk in relation to mastitis.

**Society News**—Dr. Philip S. Hench, Rochester, Minn., discussed 'The Management of Rheumatoid Arthritis' before the Medical Society of Milwaukee County in Milwaukee, May 8, and Dr. Walter P. Blount, Milwaukee spoke on 'The Kenny Treatment of Polymyositis'. —Dr. William G. Lennox, Boston addressed the Milwaukee Neuro-Psychiatric Society in Madison recently on 'Ewms, Brain Waves and Epilepsy'. —At a meeting of the Milwaukee Society of Clinical Surgery, May 13 in Sheboygan Drs. Friedrich Ligenberger, Sheboygan spoke on 'The Use of the Polytograph for Laboratory Diagnosis' and Paul B. Mason, Sheboygan, 'Preoperative and Post-operative Medical Care of Surgical Patients'. —Dr. Ralph E. Campbell, Madison discussed 'Carcinoma of the Uterus' before the Sheboygan County Medical Society in Sheboygan recently. —Dr. William F. Braasch, Rochester, Minn., addressed the Rock County Medical Society recently on 'Advances in the Treatment of Urinary Fracture Infections'.

### GENERAL

**Dr. Upham Named Chairman of Parenthood Foundation**—Dr. John H. J. Upham, Columbus, Ohio, formerly President and Trustee of the American Medical Association, was recently chosen president of the board of directors of the Planned Parenthood Foundation of America, Inc.

**Research Chemicals Division Created at Breon and Company**—The George A. Breon & Company laboratories, Kansas City, Mo., have established a research chemicals division which will prepare synthetic organic chemicals including bile acids, hormones and vitamins. The catalogue listing these products was recently distributed to research workers in the medical sciences according to an announcement from the company. The new department will be under the direction of Clarence W. Sondern, Ph.D., Kansas City, and Willard M. Hochm, Ph.D., formerly of Rochester, Minn.

**Motion Picture on Back Siphonage**—Pure Water Films, Inc. has prepared a motion picture illustrating the danger to health of faulty plumbing using a story based on a law suit. THE JOURNAL, August 22, page 1437 announced that this film had been prepared by the Plumbing and Heating Industries Bureau. The picture shows clearly that disease may result from the drinking of polluted water caused by back siphonage of plumbing fixtures. It is available for showing before medical students, medical societies and county health officers. Those desiring to borrow this film may communicate with Mr. William J. Lang, chairman of the Motion Picture Project Committee of the National Association of Master Plumbers, 1251 North Clark Street, Chicago.

**Physicians Reported Missing**—The following physicians have been reported missing, according to recent newspaper reports:

Lieut. Edward F. Ritter, Jr., Mattoon, Ill., M. C. U. S. Navy, Lieutenant Ritter was said to be in service on Corregidor and is believed to be a war prisoner of Japan.

Capt. Robert G. Davis, M. C. U. S. Navy, Dr. Davis was commanding officer of the U. S. Naval Hospital, Canacao, P. I. at the time war was declared.

Capt. Wilbert W. Buckhold, Blackey, Ky., M. C. U. S. Army, Captain Buckhold is believed to have been captured on Corregidor.

Dr. Jacob Markowitz, Toronto, Ont., Canada missing in the recent operations in Malaya.

Dr. John D. Greathouse, U. S. Navy Reserve, Minneapolis, lost at sea somewhere in the Pacific. He was in charge of personnel on a Standard Oil Company tanker.

**Grenfell Mission Unveils Anniversary Tablet**—A tablet was unveiled at St. Anthony, Newfoundland, August 4, to commemorate the fiftieth anniversary of the landing of the late Dr. Wilfred Grenfell on the coast of Labrador. Sir Wilfred established the mission in Labrador in 1892. Since his death on Oct. 9, 1940 the activities of the mission have been carried on under the direction of Dr. Charles S. Curtis, St. Anthony. During the fifty years of Sir Wilfred's missionary work five hospitals have been established there, five nursing stations, two boarding schools, one day school and children's home, social services to improve the lot of the coast people, two hospital ships and a supply ship. The inscription on the new tablet reads: 'In gratitude to God for the Labrador Doctor'. The Grenfell Association of America is located at 156 Fifth Avenue, New York.

**Nutrition Foundation Publishes Journal**—Nutrition Reviews has been established as the official journal of the Nutrition Foundation, Inc., New York, with Dr. Frederick J. Stare, assistant professor of nutrition and biochemistry, Harvard University, Cambridge, Mass., as editor. It will be supervised by an editorial committee representing nutrition research and

medicine. The new journal will appear monthly. The foundation announces that six new member organizations had contributed new subscriptions amounting to \$75,000, raising the foundation's fund to support nutrition research to \$923,500. The foundation is now supporting thirty-six nutrition research studies in twenty-two leading universities of the nation. These studies are divided equally among three kinds of projects: those having a direct relationship to the war emergency, those having a direct relationship to public health and those that primarily advance the frontiers of the science of nutrition.

**Examination in Ophthalmology**—The American Board of Ophthalmology announces that the examinations will be held in New York December 1-16 and Los Angeles January 15-16 because of the war emergency. It was decided to cancel the 1943 written examination to include in the oral examination all the subjects previously covered by the written examination and to dispense temporarily with the requirement of case reports. The oral examination will probably require two or three days and will cover external disease, slit lamp, ophthalmoscopy, histology, pathology, bacteriology, oculin motility, refraction, retinoscopy, practical surgery, anatomy and embryology, primary therapeutics and operations, optics and visual physiology and relation of the eye to general diseases. Applications on the proper blanks for the December and January examinations must be filed with the secretary not later than November 1. Blanks may be obtained from the American Board of Ophthalmology, 6800 Waterman Avenue, St. Louis.

**Congress of Physical Therapy**—The American Congress of Physical Therapy will hold its annual session at the Hotel William Penn, Pittsburgh, September 9-12. A series of instruction courses will be held throughout the entire session. Among the speakers on the program will be:

- Stafford I. Osborne, Ph.D., Chicago, Present Status of Electromuscle Stimulation
- Dr. William Cooper, New York, The Problem in Cerebral Palsy
- Dr. Fred Bennett Moor, Los Angeles, The Future of Physical Medicine
- Dr. Paul B. Magnuson, Chicago, Painful Bial
- Dr. Harry F. Zinkel, Brooklyn, The Galvanic Bath
- Dr. Ralph Pemberton, Philadelphia, Refinements in the Treatment of Arthritides Including Physical Therapy
- Dr. Christopher J. McLoughlin, captain, U. S. Army, Atlanta, Physical Therapy in Relation to Military Medicine
- Dr. Bengt N. Bengtson, lieutenant commander, U. S. Navy, Great Lakes III, Sustained (or Prolonged) Radiant Heat Therapy in Lesions of the Pelvis

There will be a symposium on poliomyelitis on Thursday with Drs. John A. Toomey, Cleveland, Jessie Wright, Pittsburgh, and Miland E. Knapp, Minneapolis. A symposium on fever therapy on Friday will be conducted by Drs. Earl C. Elkins, Rochester, Minn., Herbert Wooley Kendall, Dayton, Ohio, Robert F. Dow, Paterson, N. J., John W. Fredette, Pittsburgh, Frederick M. Allen, New York, and Lyman W. Crossman, New York.

## FOREIGN

**Pasteur Journal Prohibited**—The Germans have forbidden the publication of the Journal of the Pasteur Institute of Paris, the Chicago *Sun* reported, July 25. The report stated that the journal was founded in 1881 by Pasteur himself.

**Prizes for Encephalitis Research**—The Foundation at the University of Berne to promote encephalitis research announces its annual prizes for work on encephalitis lethargica showing real progress in the diagnosis or treatment of the disease. The smallest prize amounts to 1,000 Swiss francs. The prizes are awarded at the end of each year. Those wishing to participate in the competition should send their application to the dean of the faculty of medicine at the University of Berne.

**Rockefeller Grant to Nutrition Survey**—The Rockefeller Foundation has made a grant of £1,875 toward the expenses of the Oxford Nutrition Survey during the past year and has promised a grant of £3,000 for each of the next two years. The funds will be administered by a committee consisting of the regius professor of medicine, the Whitley professor of biochemistry and the Waynflete professor of physiology. According to *Science* the survey is investigating economic, dietary, clinical and biologic methods of assessing nutrition in man. Besides giving training in their use it is also, on behalf of the Ministry of Health, examining the nutrition of samples of the population.

**German Narcotic Law Amended**—Effective as of July 1, 1941, a decree of the reich minister of the interior subjected the distribution of the following chemicals to the restrictions imposed by the narcotic law of Germany: methylphenylpiperidin-

carbamic acid-ethyl-ester ("Dolantin"), phenylaminopropane ("Aktedron," "Benzedrin," "Elastonon") and phenyl-methyl-aminopropane ("Pervitin"). The decree was signed in behalf of the minister of the interior by Dr. L. Conti, who is the leader of the health office of the party and leader of the German physicians (reichsarztbefehl). Dr. Conti, it is said, is known to be a very active opponent of habit forming stimulants and to favor a strict enforcement of the narcotic laws and of the laws pertaining to abortions.

## SPECIAL NEWS

(THIS NEWS WAS ASSEMBLED ESPECIALLY FOR USE IN THE JOURNAL)

**Public Health under Hitler's Rule**—The *Neues Wiener Tagblatt* reports the opening by Gauleiter Dr. Jury of the Central Office for Childless Marriages, which has been set up within the Chief Health Office of the Gau Niederdonau. Among the guests present were Dr. Fehrer, chief of the Gauleitung for Racial Policy, SA-Obergruppenführer von Schorlemer, Gauleitungsführer Dr. Tangl, Gaufrauenenschaftsleiterin Ann Victoris Gauhauptmann Dr. Mayer, Generalstabsarzt, Dr. Zimmer, Generalarzt Dr. Zeman and Dr. Albrecht, Prof. Dr. Knoll (rector of Vienna University) and the deans of the medical and philosophical faculties, Professor Pernkopf and Professor Christian. Dr. Fehrer said that is the aim of the central office to provide biologically sound but hitherto childless married couples with all the resources of medical art to remove infertility and also to insure that married couples will not have to forego treatment simply because they cannot afford the expense. After the war the present institute would develop into an institute for research into human fertility. Dr. Jury said "I am glad that it was my gau in which it has been possible to set up the first central office for childless marriages, and I believe that it will prove not only important for the war but also important for the reich (reichswichtig)."

DNB reported that Schirach paid a surprise visit to a number of camps of the child evacuation scheme in the Harz area, where children from northwest German towns which are particularly exposed to, or have particularly suffered from, air raids have been staying for some months. The condition of all camps was irreproachable. The health of the children was incomparably better than on their arrival, thanks to the favorable position of the camps and the very ample food. Parents recently visited all the camps.

The *Deutsche Zeitung*, Budapest, notes that a thousand rooms have been reserved for wounded Hungarian soldiers in various bathing resorts on Lake Balaton.

The Scandinavian Telegram Bureau reports from Rome that at Bari a military tribunal has sentenced nine military doctors, twelve civilians and twenty-three soldiers to long terms of imprisonment for illegal traffic in health certificates. For payment the doctors procured sick leave permits and in some cases exemption from military service. The doctors were sentenced to terms of imprisonment ranging between seven and twelve years, the soldiers from six to seven years and the civilians up to fourteen years.

The *Revaler Zeitung* reports that the villages of Illurma and Walkse in the Keila parish, Estonia, are declared to be menaced by rabies.

The Berlin correspondent of the *Aftonbladet* quotes the annual review of the Central Bureau of Statistics as calling for a rise of 60 or 70 per cent in the German birth rate "to put the German people in a position to deal with the tremendous tasks awaiting them." The number of families with three children or less has risen since 1933 by 1,700,000, while in the same period the number of large families has diminished by 80,000.

The *Völkischer Beobachter*, in an editorial by Fritz Nonnenbruch, advocates the necessity of increasing the birth rate. "We Germans will become a herrenvolk, and have never before in our history felt the call to become a herrenvolk more strongly than now. The task of a healthy herrenvolk—in contrast to a parasite people—does not consist in enjoying life. Our people's task is more serious, greater and more far reaching. A herr is a person who can be what he is, who develops his mind and characteristics freely. Therefore a herrenvolk is a people that develops its mind and characteristics freely. Our postwar tasks consist in exhausting the immense possibilities which our soldiers' victory opens up to us, this in the first place involves, literally speaking, growing into these possibilities as far as figures are concerned. The greater reich's greater tasks demand a greater people."

LONDON

(In Our Regular Correspondent)

July 18 1942

### Polish Medical Journal Published in England

There are many Polish refugees in this country the majority of whom are soldiers. The foundation of a Polish Faculty of Medicine in Edinburgh University has been described previously (THE JOURNAL January 24 p. 513). After a lapse of two years the Poles have continued in England publication of their only surviving medical periodical the *Lekarz Wojskowy* the Journal of the Polish Army Medical Corps. Its object is to describe the experience gained by Polish doctors during the war and to facilitate contacts of the Polish medical circle with the wide English speaking medical world. The periodical is in its thirty-fourth volume and has published in England three numbers. The articles are in Polish but summaries in English are added. In an attempt to excuse their barbarity the Germans have pretended, with their usual effrontery, that the Poles have no civilization worthy of the name. The pages of the *Lekarz Wojskowy* certainly do not support this aspersion for the articles are of an unusually high standard. In one entitled 'A Theory of True Uremia' A. Fidler points out that the theory that uremia is due to impaired renal function lacks proof namely diminution of nonprotein nitrogen in the urine. Investigations at the University of Warsaw showed that the amount is slightly increased over that in health. Hence arose the idea that the retention of nonprotein nitrogen is due to the breakdown of proteins in the blood and tissues. This was confirmed by demonstrating that the proteins of the serum are altered in their physicochemical structure and so are liable to break down which leads to the conclusion that uremia is a disease of the blood rather than of the kidneys.

B. Hejduk deals with 'The Organization of Field Surgery in Modern War'. Such is the enemy that he has to write large unprotected hospitals far behind the front have not proved satisfactory, as they can easily be bombed. The evacuation of hospitals by ambulance trains has failed as the lines are frequently damaged. Work is now possible only in small well protected hospitals. Operation theaters and wards are installed in underground shelters such as wine cellars and crypts.

Prof. D. Cordier discusses 'Anoxemia in Traumatic Shock'. He holds that anoxemia probably plays the most important part and that therefore the sooner oxygen therapy is used the better.

H. Back deals with avitaminosis in the army. A large part of the vitamins is lost in the intensive army cooking. Vitamin A deficiency may be produced and shown by sporadic night blindness. Vitamin C deficiency is shown by inflammation of the gums and eczema.

### Medical Supervision of the Young After Entering Industry

The history of the medical profession in this country in recent years can be summed up in three words—increased state control. The London Regional Advisory Council for Juvenile Employment has made the latest proposal in this direction in a memorandum submitted to the Ministry of Labor and National Service. The council assumes that the school leaving age will be raised from 14 to 15 and possibly to 16 years and that compulsory day continuation classes will be set up for juveniles beyond the age for leaving school. The council recommends an extension of the school medical service to all minors in industry by an arrangement which would empower the medical staff of the local authority to supervise even where it did not itself provide all medical treatment including psychotherapy, from nursery school to the end of adolescence in industry.

### Delayed Union of Fractures

Delayed union of fractures was discussed at a meeting of the British Orthopaedic Association on the basis of war experience, in which American and Canadian surgeons on duty in this country took part. Mr. R. Watson Jones and Squadron Leader W. D. Collett presented an analysis of five hundred fractures of the shaft of the femur or tibia treated in the orthopaedic units of the Royal Air Force. The most important factors responsible for delayed union were (1) infection, (2) distraction of the fragments by excessive skeletal traction and (3) delayed reduction. Late manipulation and in the femur, late bowing or retraction. In the absence of these delaying causes, union was firm enough for removal of splints or plaster in an average of fourteen weeks. When minor angulation remained, early resumption of weight bearing, in a walking plaster constituted a delaying factor. Thus by increasing the angulation momentarily distracted the fracture on its open side. If the cause of the delay was recognized and the period of plaster immobilization extended the result was slow union.

Prof. Harlan L. Wilson of the U. S. Public Health Service believed that the type of initial violence might account for the greater time taken for motorcycle injuries to heal. The speed of impact was noteworthy. Damage to the vascular supply of bone influenced greatly the time of healing. Multiple fractures by making greater demands on the osteogenic functions, accounted for the frequency of delayed union in these cases.

Major A. W. M. White of Toronto said that the factors most likely to affect the rate of union were apposition of the fractured surfaces and complete and continuous immobilization. In fifty one well reduced and immobilized legs the average time for union was four and a quarter months, in thirteen inadequately reduced or poorly immobilized cases it was eight and a quarter months.

(From a Special Correspondent)

July 4 1942

### Growth Vitamins and Alimentation

After nearly two years of alimentary restrictions the most urgent problem for the physicians of France consists in observing children. The growth of children their physical and psychic development is now the greatest biologic problem.

Charles and Gabriel Richet, members of the Academie de medicine have written a book on the problems of puberty and adolescence which is soon to be printed. They published a chapter of the book called 'Biologic Growth Value of Aliments' in the *Paris medical* January 30. The authors discuss the amino acids of growth and the growth vitamins. The American authors Osborne and Mendel established that for normal growth 18 per cent of the caloric ration should be proteins. They have proved with Ackroyd and Hopkins that these proteins must be rich in lysine and histidine, which are the most important amino acids of growth.

As worked out particularly by the French school vitamin A is chiefly a vitamin of growth. Vitasterin A is found only in animal aliments. In the form of provitamins (an expression of Lesne and the Richets) it exists in various vegetables. It is to be found in the form of carotenes  $\alpha$  and  $\beta$  ( $C_{40}H_{56}$ ). The carotenes are transformed in the liver into vitamin A ( $C_{20}H_{30}O$ ) this transformation is often incomplete. Carotene  $\beta$  can theoretically divide itself into two molecules of vitamin A. Carotene  $\alpha$  gives only one molecule. The digestive absorption of carotene is often difficult because of part of it being retained by cellulose rejected by the bowels. The biologic value of carotenes is less than that of vitamin A.

The vitamin specialist Javillier maintains that a certain quantity of growth vitamin A must always be given in the form of the genuine vitamin A and that the remainder can be pro-

vided as carotenes. For adults the vital or functional minimum of vitamin A (antixerophthalmic and of growth) is admitted to be 0.5 mg. daily, the optimal dose 1.5 mg., of which 0.5 mg. must be given in the form of vitamin A and 1 mg. (corresponding to 2 mg. of carotene) can be taken in the form of carotene. Javillier believes that children need a dose only half as large. Richet, on the contrary, maintains that children must have more vitamin A than adults because there is no growth for adults and because xerophthalmia and hemerolopia are more frequent among adolescents and children than among adults. Froge has found in 70 children aged 11-18 years in Lille 17 suffering from hemerolopia. All belonged to badly nourished workmen's families. Examining other children from Paris, he found the same proportion.

The problem of vitamin B is more complex. We do not know exactly that vitamin B or riboflavin, figures in the growth of a child. This vitamin, as well as vitamins B<sub>2</sub>, B<sub>6</sub> and B<sub>12</sub>, is clinically and biologically still rather badly individualized. The vitaminosis syndrome of B<sub>2</sub> is not known in man. Riboflavin is probably synthesized by vegetables and accumulated in animal tissues. Most aliments contain riboflavin, and it seems that it is contained in a sufficient quantity in the present food of children. Javillier states that the content of vitamin A in certain aliments is as follows (in milligrams and per hundred grams of edible products the content in carotene and vitamin A).

| Carotene                         |     | Vitamin A                     |      |
|----------------------------------|-----|-------------------------------|------|
| (Exclusively Vegetable Aliments) |     | (Exclusively Animal Aliments) |      |
| Spinach                          | 8   | Liver (veal)                  | 6    |
| Carrots                          | 2   | Butter                        | 2    |
| Pumpkin                          | 1.2 | Egg yolk                      | 2    |
| Lettuce                          | 1.2 | Tunny                         | 0.30 |
| Watercress                       | 0.9 | Oysters                       | 0.12 |
| Tomato                           | 0.9 | Herring                       | 0.09 |
| Maize                            | 0.3 | Cow's milk                    | 0.09 |
| Peas                             | 0.1 | Mussels                       | 0.02 |

Corn germs contain 0.2 to 0.3 mg. of carotene and potatoes about 0.04 mg. per hundred grams of product.

The quantity of genuine vitamin A is absolutely insufficient in the present food ration, which is almost entirely deficient in butter and extremely poor in meat. This is the reason for growth difficulties signalized by all physicians after many examinations of school children.

Professor Hedon, Montpellier physiologist, signalized that examinations performed by him in 1941 revealed a slight deficit of vitamin A in 50 per cent of the children examined. This year the examinations prove that the rate of vitamin A is absolutely insufficient in 80 per cent of the children examined.

Present Increase of Scabies

At a recent meeting of the Academie de medecine Professor Leroux and Dr. Pignot reported that, in 1941, 60,567 scabies patients were treated in the Hopital St. Louis in Paris. The annual average from 1920 to 1938 was 4,500-5,000. In comparison with the period before this war the development of scabies has been multiplied at least by 5 and sometimes even by 30. Many persons suffering from scabies believe the restriction of bread to be the cause of this disease, calling it "gale de pain" (scabies due to bread). In nearly all cases it is, however, a genuine human parasitic scabies. This epidemic of scabies is due to two causes: (1) the war, the evacuation of children and the exodus of June 1940, (2) deficient hygiene, which is prolonging and maintaining this epidemic on account of the lack of soap and of individual hygiene. The monthly allowance of soap for hygienic use and also for washing underwear and linen amounts to only 75 Gm. On account of a special law physicians, surgeons, dentists, veterinarians and

professional nurses get a supplement of 150 Gm. of soap for their personal use and 500 Gm. of soap detergents for other use.

The treatment of this great number of scabies patients at first involved enormous difficulties because fat and benzyl benzoate are lacking. Lerou reports that, nevertheless, he has succeeded in treating the patients by means of an ointment prepared of sulfur and its compounds, the base was made of a colloid clay of the bentonite series, which has replaced the lacking fatty substances. After soaping the body and after a bath one applies, as soon as the patient comes out of the bath without having wiped himself, this paste in a thin but continuous layer. After twenty-four to forty-eight hours a simple bath is given. The results of this treatment are satisfactory.

Lannay and Verliac explain the scabies epidemic among children in the April issue of *Hopital*. In infants the disease can manifest itself often in the form of an impetigo or a pyodermitis. Lannay proposes to treat the secondary infection with a sulfonamide applied locally in an ointment and by mouth. With these medicaments he has obtained good results in numerous cases and has been able to proceed quickly with the anti-scabies treatment.

Death of Professors Loir and Marfan

One of the last direct collaborators of Pasteur has died. Professor A. Loir did much research work with him and rendered great service at the period in which Pasteur was affected by hemiplegia. Loir founded the Pasteur institutes of Leningrad, Sidney, Tunis and Rhodesia. For some time he has been professor of biology and pathology at Montreal. He was a corresponding member of the Academie de medecine. An eminent hygienist, he was until lately director of the Bureau d'hygiene of Le Havre.

One of the greatest pediatricians of France, Prof. A. B. Marfan, has died at the age of 83. He was the disciple of Professor Lasegue. In 1912 he was professeur agrege at the Faculte de medecine of Paris and then professor of hygiene and of the child clinic at the Hopital des enfants assistes. His first researches were on tuberculosis. He proved that a local attack gives a certain immunity against severe forms of the disease. He studied the secondary syndromes of malignant diphtheria. He described a new disease called dolychostenomelia. Until lately he was president of the Comite national de l'enfance.

Marriages

- RALPH L. BEST, Newport, Ark., to Miss Rachel Ward Browne of Tuscaloosa, Ala., in Tulsa, Okla., in June
- THOMAS HASSELL WRIGHT JR., Philadelphia, to Miss Elizabeth Sergeant Odell of Concord, N. C., June 13
- HILARY H. HENDERSON JR., Greenville, Ala., to Miss Margaret Drennen Bissell of Birmingham in June
- HAROLD FOREST OAKES, Laura, III, to Miss Beulah Lynch of El Paso, Texas, in Reno, Nev., May 16
- JEROME CHAMOVITZ, Aliquippa, Pa., to Miss Irma Rae Goldstein of Ambridge at Pittsburgh, June 28
- HOWARD HILT HAMMETT JR., Atlanta, Ga., to Miss Katherine West Johnson in Rome, June 12
- WILLIAM CRAIG PARKS to Miss Mary Ruth Brower, both of High Point, N. C., June 20
- JOSEPH A. CARBONE to Miss Damaris Snell, both of Gary, Ind., in New York recently
- FERDINAND GEORGE KOJIS to Miss Harriet Henderson, both of New York, June 6
- HERBERT CHARLES MAYER to Miss Clara M. Bauer, both of Brooklyn, June 6
- WILLIAM J. STAPLETON JR. to Miss Helen Vernon Hall, both of Detroit, June 20
- JOSEPH L. SPEZIA, Herrin, Ill., to Miss Eileen O'Keefe of Chicago in June

## Deaths

Alice Gertrude Bryant † Boston, Woman's Medical College of the New York Infirmary for Women and Children, New York, 1890, specialist certified by the American Board of Otolaryngology, member of the American Academy of Ophthalmology and Otolaryngology and the New England Otolaryngological and Laryngological Society, fellow of the American College of Surgeons, on the staffs of the Ancient Memorial Hospital, the New England Hospital for Women and Children and the New England Deaconess Hospital, aged 80, died July 25, in the Palmer Memorial Hospital of carcinoma of the cecum and diabetes mellitus.

Gustav Kolischer † Chicago, Medizinische Fakultät der Universität Wien, 1880, formerly associate professor of genitourinary diseases, Post Graduate Medical School, president of the Chicago Gynecological Society in 1910, of the Chicago Urological Society in 1916 and 1932, and of the American Congress of Physical Therapy in 1932, member of the American Urological Association, founder of the departments of genitourinary diseases and member of the staffs of Mount Sinai Hospital and Michael Reese Hospital, where he died, August 11, aged 78, of pneumonia.

Charles Lemuel Marston, Mason City, Iowa, Rush Medical College, Chicago, 1893, member of the Iowa State Medical Society, fellow of the American College of Surgeons, past president of the Cerro Gordo County Medical Society, served with the American Expeditionary Forces during World War I, retired lieutenant colonel in the medical reserve corps, formerly member of the House of Representatives, on the staffs of the Story and St. Joseph's Mercy hospitals, aged 72, died June 25, of coronary thrombosis.

Dred Rumley Dorente, Ada, Okla., College of Physicians and Surgeons, Dallas, Texas, 1907, Chicago College of Medicine and Surgery, 1913, member of the American Academy of Ophthalmology and Otolaryngology, fellow of the American College of Surgeons, specialist certified by the American Board of Otolaryngology, formerly on the staffs of the Sparks Memorial Hospital and St. Edwards' Mercy Hospital, Fort Smith, Ark., aged 61, died, June 17, of cerebral hemorrhage and hypertension.

George Moses Price † New York, University of the City of New York Medical Department, New York, 1895, inspector for the health department from 1895 to 1904, director of the joint board of sanitary control, medical director of the Union Health Center, author of *A Handbook on Sanitation, Tenement Inspection, Hygiene and Public Health, Hygiene and Sanitation for Nurses* and *The Modern Factory*, aged 78, died July 30, of cerebral thrombosis and general arteriosclerosis.

Clarke Campbell Patton † Ashland, Ohio, University of Wooster Medical Department, Cleveland, 1910, past president of the Ashland County Medical Society, served as a first lieutenant in the medical corps of the U. S. Army at base hospitals in France during World War I, formerly assistant pathologist and bacteriologist at the University of South Dakota, Vermillion, on the staff of the Samaritan Hospital, aged 58, died June 11, of coronary disease and diabetes mellitus.

Jesse Luther Lenker † Harrisburg, Pa., Baltimore Medical College, 1907, past president of the Pennsylvania Heart Association, past president and secretary of the Harrisburg Academy of Medicine and the Dauphin County Medical Society, fellow of the American College of Physicians, served during World War I for many years president of the staff and formerly medical director of the Harrisburg Hospital, aged 59, died June 2, of cerebral hemorrhage.

Kyle Bear Steele † New York, University of Virginia Department of Medicine, Charlottesville, 1913, associate professor of clinical obstetrics and gynecology at the Cornell University Medical College, fellow of the American College of Surgeons, served during World War I on the staffs of the Booth Memorial Hospital, New York Hospital and the New York Infirmary for Women and Children, aged 52, died, June 18, of coronary heart disease.

Stanley G. Miner † Detroit, Detroit Medical College, 1882, emeritus professor of otology, laryngology, rhinology and physical diagnosis at the Wayne University College of Medicine, member of the American Academy of Ophthalmology and Otolaryngology, member of the city public welfare commission from 1913 to 1919, for many years on the staff of St. Mary's Hospital, aged 81, died, June 28, of chronic myocarditis.

Benjamin Alonza Rice, Forest, Va., Medical College of Virginia, Richmond, 1904, member of the Medical Society of Virginia, served as a captain during World War I and was associated with the surgeon general's office in Washington, formerly on the staff of the U. S. Veterans' Hospital, New Haven, Conn., aged 63, died, June 16, in the Virginia Baptist Hospital, Lynchburg, of coronary thrombosis.

Isaac Morris Heller † New York, Yale University School of Medicine, New Haven, Conn., 1896, specialist certified by the American Board of Otolaryngology, member of the American Laryngological, Rhinological and Otolaryngological Society, fellow of the American College of Surgeons, member of the medical board and on the staff of the Lebanon Hospital, aged 70, died June 7, of coronary occlusion.

Earle Carlisle Willoughby † North Reading, Mass., Tufts College Medical School, Boston, 1911, member of the New England Society of Psychiatry and the New England Roentgen Ray Society, on the staff of the North Reading State Sanatorium, formerly on the staff of the Tewksbury State Hospital and Infirmary, Tewksbury, aged 60, died, June 23, of cerebral hemorrhage.

Thomas Oliver Williams, Tunkhannock, Pa., University of Pennsylvania Department of Medicine, Philadelphia, 1906, member of the Medical Society of the State of Pennsylvania, served in the Spanish-American War and World War I, county medical director, chairman of the Wyoming County Selective Service System, aged 61, died, June 14, of coronary occlusion.

John Edward McHale, Brooklyn, Columbia University College of Physicians and Surgeons, New York, 1931, member of the Medical Society of the State of New York, aged 36, on the staffs of the St. Catherine's Hospital, Evangelical Deaconess Hospital, Kings County Hospital and the Victory Memorial Hospital, where he died, June 22, of malignancy of the lung.

Vernon Greene Clark † San Diego, Calif., Missouri Medical College, St. Louis, 1896, past president of the San Diego County Medical Society, served in the U. S. Navy during World War I, fellow of the American College of Surgeons, assistant superintendent of the San Diego County General Hospital, aged 69, died, June 6, of coronary heart disease.

Edward Albert Cunningham, Belmont, Mass. (licensed in Massachusetts in 1904), served as a captain in the medical corps of the U. S. Army during World War I, aged 61, on the staffs of the Cambridge Hospital, Waltham Hospital, St. Elizabeth's Hospital, Boston, and the Soldiers' Home Hospital, Chelsea, where he died, June 14, of hypertensive heart disease.

Howard Leon Jameson † Philadelphia, Medico-Chirurgical College of Philadelphia, 1906, professor of clinical medicine at the Medico-Chirurgical College, Graduate School of Medicine, University of Pennsylvania, specialist certified by the American Board of Internal Medicine, fellow of the American College of Physicians, aged 61, died, July 1, of cerebral thrombosis.

George Forbes † Brooklyn, University of the City of New York Medical Department, New York, 1890, fellow of the American College of Physicians, member of the Radiological Society of North America, Inc., attending roentgenologist to the Wyckoff Heights and Bethany Deaconess hospitals, aged 74, died, June 23, of carcinoma of the colon.

William Sylvester Darling, Milwaukee, Wisconsin College of Physicians and Surgeons, Milwaukee, 1903, member of the State Medical Society of Wisconsin, served in the medical corps of the U. S. Army during World War I, on the staff of St. Joseph's Hospital, aged 65, died, June 16, of cerebral hemorrhage, pneumonia and bronchiectasis.

Robert Stockton Hinchman, McKeesport, Pa., Western Pennsylvania Medical College, Pittsburgh, 1906, member of the Medical Society of the State of Pennsylvania, served in the medical corps of the U. S. Army during World War I, on the staff of the McKeesport Hospital, aged 61, died, June 23, of carcinoma of the stomach and liver.

Adah McMahan † LaFayette, Ind., Northwestern Woman's Medical School, Chicago, 1897, served in France during World War I, formerly member of the state board of health, aged 73, on the staffs of the LaFayette Home Hospital and St. Elizabeth Hospital, where she died, June 24, of postoperative shock following cholecystectomy.

## Bureau of Investigation

## STIPULATIONS

## Agreements Between Federal Trade Commission and Promoters of Various Products

The following items are abstracts of stipulations in which promoters of patent medicines or medical devices have agreed with the Federal Trade Commission to discontinue certain misrepresentations in their advertising. These stipulations differ from the "Cease and Desist Orders" of the Commission in that such orders definitely direct the discontinuance of misrepresentations. The abstracts that follow are presented primarily to illustrate the effects of the provisions of the Wheeler-Lea Amendment to the Federal Trade Commission Act on the promotion of such products.

**Amogen Tablets**—In July 1941 J. R. Hodges trading as Amogen Company, San Antonio, Tex., stipulated with the Federal Trade Commission to cease representing that this product is a laxative gets the person out of the system cures the bile to flow effectively treats biliousness, indigestion, common colds and fever, poor digestion and gas in the stomach, the results of excessive eating and drinking, indigestion, rheumatism and some other disorders or that the tablets will enable a person to maintain health and avoid sickness. Hodges further stipulated that he would discontinue any advertisements which failed to reveal that his product contains a mercury derivative which might injure health if taken over a long period of time and that it should not be used when abdominal pain, nausea or other symptoms of appendicitis are present unless the label clearly bears the foregoing warnings. Back in December 1930 the government chemists reported that the tablets consisted essentially of colonic and extracts of plant drugs.

**Bi Tone Liver Pills and Bi Tone Wonder Tonic**—In July 1941 the Bi Tone Corporation, Blufffield, W. Va., stipulated with the Federal Trade Commission that it would drop the word "liver" as part of the brand name of its pills and cease representing that they have a beneficial effect on the liver, that the "Wonder Tonic" increases vitality or resists disease, and that the two products taken together correct ailments originating in the liver, cause the liver to become active and healthy or correct any condition of sluggishness or debility.

**Bragg's Grass Tablets**—This product is put out under the trade style Live Food Products Company, Burbank, Calif., by a Paul C. Bragg who has posed as a health specialist, food expert and some other things. Bragg represented that the preparation is rich in vitamin A, will prevent sickness, promote health and stimulate activity. In October 1941 the Federal Trade Commission accepted a stipulation from him in which he agreed that he would discontinue these misrepresentations and also cease implying in his advertising that his product has any dietary value other than as a supplemental source of vitamin A to the extent of the number of International Units that it contains.

**Children's Mind Training Program**—This is a "course" promoted by one E. M. Kellogg of Portland, Ore., who uses the trade style Children's Mind Training Institute. In October 1941 the Federal Trade Commission announced that Kellogg had stipulated that he would cease using the word "Institute" as part of his trade name or otherwise representing that his business is an institution or organization of learning with a staff of competent, experienced and qualified educators.

**Colonial Bread**—That this is "not fattening" is necessary in a reducing diet, helps burn up body fat enables one to reduce safely or that six slices of the bread in a reducing diet will give one energy and prevent fatigue or nervous strain or that the bread will protect the user from the harmful residues that cause fatigue or that it protects one's health while reducing are misrepresentations which the Colonial Baking Company, St. Louis, agreed to discontinue, in a stipulation that it signed in August 1941 with the Federal Trade Commission.

**Dobbs Truss**—This was represented by the Dobbs Truss Company, Birmingham, Ala., as a device helpful in the treatment of rupture and the first major advancement in truss designing wholly different from any other. It was alleged to hold any rupture to be a natural healer that would aid nature in curing a rupture and bring muscles together in a manner that would cause or enable them to adhere. In October 1941 the Dobbs concern signed a stipulation with the Federal Trade Commission, agreeing to discontinue these misrepresentations.

**Eureka Springs Ozarka Water**—In August 1941 Richard R. Thompson, trading as Eureka Springs Water Company and as Ozarka Water Company, Eureka Springs, Ark., stipulated with the Federal Trade Commission that he would discontinue the following misrepresentations in the sale of this product: that it is a cure or competent treatment for any disease, that it is a laxative or that faulty elimination is the cause of all stomach trouble, indigestion, rheumatism or diseases of the liver, kidneys or bladder, that this water has any value due to radioactivity, that it is the purest natural water on the American continent or known to scientists, that undistilled or naturally pure water is the only water to be recommended for use or that distilled water is poisonous.

**Hercules Wild Juices**—Under the Hercules brand the Food Balance Corporation of Chicago puts out four juices purporting to be based on wild fruits. In August 1941 this concern stipulated with the Federal Trade Commission that it would no longer represent that its "Hercules Wild Blackberry Juice" will prevent or benefit anemia or favorably affect such symptoms of it as fatigue, palpitation of the heart, pains in the head or the back or lack of sex vigor, or offer any material benefit during menstrual periods, that "Hercules Wild Cherry Juice" will serve as a general tonic or invigorate the system or beneficially affect the heart or bowel muscles, stomach, liver, uterus or other parts of the body, that "Hercules Wild Blueberry Juice" will tone or otherwise benefit the system or prove an effective antacid or stomach remedy, that "Hercules Wild Elderberry Juice" will have an invigorating or emetic effect on the female generative system or that any of these juices will purify the blood, will overcome disorders of the body or be of significant nutritional or medicinal value or supply minerals or other elements in significant amounts.

**Home Treatment Products**—These are put out by a James M. O'dell, trading as the Home Treatment Service, Chicago. They consisted of "Pur-Lax Compound No. 1," "Laxative Tea Compound," "Bathing Tea 222," "Laxative," "Nerve Sedative Compound" and "Home Ointment." In August 1941 O'dell stipulated with the Federal Trade Commission that he would cease representing that the use of one or more of these products is a cure or remedy for physical disorders or that through such use health may be regained, the body, nerves or blood strengthened, cleansed or healed or operations avoided, that such use is an effective treatment for stomach disorders, cystitis, rheumatism, intestinal and kidney troubles and some other conditions. O'dell further agreed to cease representing that "Pur-Lax Compound No. 1" is a remedy for stomach ailments, that "Nerve Sedative Compound" will make the nervous system healthy or that "Home Ointment" is an effective treatment for rheumatism, neuralgia or similar disorders, that anything he designated by the term "Pur-Lax" or similar term is composed entirely of herbs, unless such is the fact or through his use of the words "Nerve Sedative" or any similar terminology, that any product of his possesses sedative properties.

**Lacto Cal**—This is put out by one Olive M. Goulet trading as the Lacto Cal Laboratories, Los Angeles, who stipulated with the Federal Trade Commission in August 1941 that she would withdraw the following misrepresentations in the sale of her product: that it benefits the nerves, speeds up or aids digestion or increases the flow of the gastric juices, that it possesses tonic effects and is a general gland builder, that it will feed the brain, nerves, tissues, testicles or ovaries, that the preparation is a scientific compound of lactic acid and calcium or contains calcium in sufficient amounts to be of therapeutic value, that its use will reduce acidity or afford relief for that condition or be of benefit to the circulatory system or affect the metabolism, that it will prolong life or enable one to live to be 100 years old or any other definite age, that it contains vitamin B, vitamin D, phosphorus or any elements essential to the building of hemoglobin or that the general dietary condition of the American people is such as to make the use of Lacto Cal advisable. It is worth noting also that in February 1938 a district federal court declared that a consignment of Lacto Cal that had been shipped in interstate commerce was fraudulently represented on the labels as a cure for rheumatic conditions, intestinal disorders, heart trouble and many other things. Government chemists reported that it was essentially a mixture of water, lactic acid, calcium lactate and small amounts of compounds of sodium, magnesium, chlorine and sulfur, as well as volatile acid and coloring.

**LD Lax and Lacto Dextrin**—These are products of the Battle Creek Food Company, Battle Creek, Mich., which in October 1941 signed a stipulation with the Federal Trade Commission to discontinue the following misrepresentations: that LD Lax relaxes or rests the colon or intestines, combats or allays infection in the colon, is a remedy or cure for constipation and has value as a treatment for stomach disorders, and that Lacto Dextrin restores health to the digestive system and a healthy balance to the intestines besides dispelling headaches, nervousness, exhaustion, morning fatigue, gastric acidity and some other ailments.

**Natural Health Products Nostrums**—These are put out by a Morris Botwin of New York, doing business as the Natural Health Products Company. In October 1941 the Federal Trade Commission reported that Botwin had signed a stipulation in which he agreed to discontinue advertising misrepresentations of which the following are brief abstracts: that "Vitameal" is a "life food" loaded with minerals and vitamins, that "Instant Manam" is a cure or remedy for intestinal ulcers and other diseases, that "Vita Ferro" is a soybean milk drink rich in iron, phosphorus or other organic materials, that "Co Veg" is a substitute for coffee, antidotes its effects and is rich in any vitamin or mineral, that "IO Sol" will prevent or overcome pyorrhea or other mouth diseases, that "Sea Tabs" is a gland tonic, that "Natural Herb Tea" is a cure for skin eruptions, that "Vegeton Soap" corrects enlarged pores or prevents athlete's foot or other skin infections, that "Vegeton Hair Preparation" is of value in treating dandruff, brittle or falling hair, that "Vegeton Skin Cream" is antiseptic and keeps the skin youthful, that "Lupulo Honey" is a remedy for asthma, that "Garlic and Parsley Pellets" is valuable in treating high blood pressure or that "Natural Herb Tea," "Lupulo Pine Oil" and "Vegeton Body Soap" when used alone or in combination give relief in rheumatism, arthritis or neuritis. Botwin further agreed to cease using the term "Vita" as part of the brand name for any of his products or otherwise implying that they contain vitamins in significant amounts to discontinue using the term "Ferro" as part of the brand name for Vita Ferro and representing that it contains iron in significant amounts. He further agreed to drop the term "Instant Manam" which would imply that it has immediate action and also the term "Veg" as part of the brand name of Co Veg or otherwise to cease representing that it is composed wholly of vegetable ingredients.

**Ozone Air**—This was put out by a Clyde Scherpress trading as Ozone Air Company, Grand Rapids, Mich. In September 1941 Scherpress stipulated with the Federal Trade Commission that he would discontinue advertising that his machine or devices designated "Ozone Air" or any similar device have any therapeutic value that they will eliminate foul air or offensive odor, exclude all foreign matter in the air, destroy very things not naturally a component part of the air or render carbon monoxide harmless or that they are conducive to health.

**Phillips and Vigro Products**—These were put out by a Stanley N. Phillips and a Walter M. Come doing business as Parks Phillips Health Foods Company, formerly Parks Health Food Company, Cincinnati. In September 1941 the persons stipulated with the Federal Trade Commission to discontinue the following misrepresentations in their advertising that Phillips Alfalfa and Mint Tea is of any benefit in treating prostate trouble, overactivity, arthritis, and rheumatism; that Phillips Wheat Germ Meal is rich in four vitamins, revitalizes and restores needed elements to the diet, benefits faulty digestion and nervous conditions except those caused by a vitamin B deficiency; that Phillips Vegetable Mucous is of any appreciable value in treating stomach ulcers, hyperacidity, or colon irritation; that Vigro Carbo Tablets are rich in vitamins A, B, and C, or in potassium, calcium, phosphorus, iodine, or food chemicals or possess any nutritional value or produce any appreciable therapeutic effect beyond that of a light temporary decrease in blood pressure; that Vigro Vitamin Tablets help to combat germ, eradicate cells, or turn in abundance of protection against every possible winter sickness or that Vigro Laxative No. 2 increases intestinal or liver activity.

**Right O Products**—In September 1941 Robert M. Froehlich trading as Right O Products Company, New York, stipulated with the Federal Trade Commission that he would withdraw the following misrepresentations in the sale of his preparations that Rejuveno restores physical and mental freshness, removes symptoms of fatigue or the feeling of old age and improves the texture of the skin and tissues that Uroduct supplies certain mineral salts needed for normal gland function or takes off excess weight or fat without exercise, dieting, use of equipment or loss of time that Testotol has a maximal content of hormone, benefits cases of functional sexual incompetency in men or enhances vital energies that Sengovon is made in Germany, prepared according to latest scientific experiences and gives marvelous or immediate results in all cases of sterility that Okia is a specific against impotence and has been tested or recommended by professors and physicians that Oototal helps to preserve nervous vigor in women or increases vital activities and that Neuramig is a prophylactic during influenza epidemics. Froehlich also agreed to cease representing that his products are tested and standardized by the most recent physiological and chemical methods and that he maintains or operates a laboratory unless such statement is true. Further, he agreed not to publish in connection with his name the word Doctor or Dr. unless it is explained that he is not a doctor or practitioner of medicine.

**Ringo**—That this product can be relied on to cure stubborn cases of ringworm and athlete's foot and be a remedy for psoriasis, soft corns, poison ivy, eczema, and skin diseases in general were misrepresentations which Goldie V. Towles trading as the Ringo Company, Detroit, agreed to eliminate from her advertising in a stipulation which she signed with the Federal Trade Commission in November 1941.

**Rubel's High Vitamin B<sub>1</sub> Wheat Bread**—This is also sold simply as Rubel's High Vitamin Wheat Bread. Frederic W. Ziv, Inc., Cincinnati, an advertising agency, signed a stipulation with the Federal Trade Commission in August 1941 agreeing to cease disseminating advertisements for the Rubel Baking Company, Cincinnati, in which certain misrepresentations were made for the Rubel product. Among these were that the bread contains per loaf as many as 800 International Units of Vitamin B<sub>1</sub> or more of that vitamin or any other than is actually the case or that when eaten in quantities ordinarily consumed the bread will supply the minimum daily nutritional requirement for vitamin B<sub>1</sub>.

**Snares Re Lef**—A stipulation regarding this product was signed with the Federal Trade Commission in August 1941 by Henry I. Snare trading as Snare Brothers Ointment Company and George J. Mergenthal and George O. Dennis trading as Snares Re Lef Sales Company, all of Chillicothe, Mo. In this they agreed to cease representing that the use of their product will prevent or cure pneumonia, asthma, hay fever, influenza, pleurisy, gout, or gonorrhea, furnish any appreciable relief from sinus disorders or various forms of rheumatism, prove beneficial in the treatment of appendicitis or severe chest colds and all types of inflammation or kill infection and germs by vapor action, that their preparation is a modern or new type of treatment and superior to similar preparations, has any properties aside from those of a counterirritant or offers more than temporary local relief to persons suffering from minor bruises or aches. Incidentally in December 1939 Henry I. Snare pleaded guilty in a district federal court in Missouri to the charge of shipping a consignment of Snares Re Lef under fraudulent representations that the product was a remedy or cure for pneumonia, rheumatism, appendicitis and some other disorders and was fined \$25. Government chemists reported at that time that Snares Re Lef was essentially a mixture of volatile oils including mustard, wintergreen, menthol, and a camphoraceous oil in a petrolatum base.

**Tonico Del Cappuccino**—That this has been approved by legal authorities, is a general tonic, possesses any other than bitter tonic properties, will increase weight, is indispensable for children or has any value beyond that of a stimulant to the appetite were claims to be discontinued in the advertising as stipulated with the Federal Trade Commission in August 1941 by Salus Laboratory, Inc. trading as Italian Imperial Company, Brooklyn.

**Tummy Toner**—This is put out by a Max H. Newman trading as the Tummy Toner Company, New York. In December 1941 he stipulated with the Federal Trade Commission that he would discontinue the following misrepresentations that the product will promote nutrition and digestion, sustain health or provide a short cut to better health, will help build one up or curb his appetite for rich fattening foods, that it will make milk more digestible or double its nutritional value or that Tummy Toner is rich in vitamin B or will give one added energy. Newman further agreed to cease representing by use of the designation "Tummy Toner" as a brand name or any other expression that his product will tone the stomach or have any value in respect thereto.

**Van Tox**—This alcohol treatment for the liquor habit is promoted by one Harry J. Knorr trading as Laboratory Products Company, Glendale, Calif. It consists of two kinds of tablets containing the same active ingredients but in different quantities and these are described as Special Formula Single Stg. 21 and 22. In September 1941 Knorr stipulated with the Federal Trade Commission that he would cease representing that Van Tox or any similar preparation is a cure, remedy, or effective treatment for chronic alcoholism or that its use will overcome the craving for alcohol and is in all cases harmless. Knorr also promised to cease using the word Laboratory or any term of similar meaning in his trade name or representing in any way that he owns or operates a laboratory.

**Vimm and Palm Co Products**—These were put out by Biofoods Corporation of New York City, which in September 1941 signed a stipulation with the Federal Trade Commission to discontinue the following misrepresentations that Fortified Palm Co. is the modern calcium phosphorus vitamin D oil or has a beneficial effect on symptoms of nervousness, low resistance, soft teeth, brittle nails, and poor endurance unless these conditions are due to a lack of calcium and phosphorus in the diet as caused with a deficiency of vitamin D that Vimm's Wheat Germ Oil Vitamin F Capsules are a concentrated source of vitamin F that Vimm's Powdered Wheat Germ or Vimm's Whole Wheat Germ are excellent sources of vitamins B<sub>1</sub>, B<sub>2</sub>, B<sub>6</sub>, and B<sub>12</sub> iron, copper, phosphorus, calcium, manganese, magnesium, and other valuable minerals or that Vimm's Powdered Wheat Germ is ideal for infant feeding and those on a bland diet. As noted in this department of THE JOURNAL, Dec. 20, 1941, page 2188, one Mariano Pollina of New York, who for a time operated as Vimm Wheat Germ Products Company and Moderno Company (at the same street address later used by the Biofoods Corporation) had stipulated with the Federal Trade Commission in March 1941 that he would discontinue certain misrepresentations for Vimm's Wheat Germ Oil Capsules, Vimm's Whole Wheat Germ, Fortified Palm Co. and Plain Palm Co. Some of these misrepresentations were similar to those named in the later stipulation signed by the Biofoods Corporation.

**Vita Health Foods**—These are put out by a Walter Camp and a Werner Orbach trading as the Vita Health Food Company, American Health Products Company and Eastern Health Food Stores Association, Washington, D. C. In August 1941 Camp and Orbach stipulated with the Federal Trade Commission that they would discontinue the following misrepresentations in the sale of their products that Almano furnishes complete proteins and other elements found in the main dish of a meal and so may be used interchangeably with other protein foods and is in many times as nourishing as beefsteak, eggs, codfish, and whole milk and less expensive than Bro Sak, improves the health of diabetics when substituted for sugar or saccharine and benefits acid stomach and other ailments due to hyperacidity that Cal Kelp Tablets correct indigestion, kin troubles, rheumatism, obesity, anemia, and underweight that Veg Salt is a valuable food accessory or will keep the body alkaline that a beverage prepared from Dalmatian Sage Leaves has a quieting effect on the entire nervous system and benefits colds and kindred ailments that Nutrolac checks harmful intestinal bacteria or helps stomach sufferers that a tea prepared from O-Pep-O-Mint is an effective treatment for colds or valuable because of the potassium and manganese that it contains that Pomona Grape Juice will give relief from bad breath, sour stomach, or similar ailments and that Seven Herbs Laxative is fat reducing, improves kidney function, or pancreas action or is recommended by physicians all over the world. Camp and Orbach further agreed to discontinue any advertisements which represent that Cal Kelp Tablets are always harmless or which fail to reveal that they should not be used by those suffering from lung diseases, chronic cough, gonorrhea, or thyroid diseases except on the advice of a physician and that their use should be discontinued if a skin rash appears. Further, the promoters were to cease running any advertisements of Seven Herbs Laxative which represent this product as being always safe to use or which fail to reveal that its use is potentially dangerous in cases of abdominal pain, nausea, vomiting, or other symptoms of appendicitis. This stipulation provided however that the foregoing warnings might be omitted from the advertising if the latter cautioned the customer to follow directions on the label provided that the label did contain the warnings mentioned.

**Vita Lite**—According to a stipulation which Vita Lite, Inc., Portland, Ore., signed with the Federal Trade Commission in September 1941, this concern is to cease representing that its devices or machines designated Vita Lite or any other ozone generating device of similar character has any therapeutic value or will destroy bacteria or aid in curing disease or that their use is indicated as a remedy or effective treatment for any ailment of the human body. The concern also promised to cease publishing or otherwise disseminating any testimonials containing statements contrary to the terms of the stipulation.

**Vit O Net**—In July 1941 the Federal Trade Commission reported that Vit O-Net, Inc., Chicago, had signed a stipulation promising to cease representing that this device, an electrical blanket, is a cure for nephritis, infections, high blood pressure, and Addison's disease.

## CAT ASSAY FOR DIGITALIS PREPARATIONS

*To the Editor*—The Revision Committee of the U. S. P. XII has adopted a cat assay for the various digitalis preparations. It is to be hoped that this action will not be construed as an endorsement of the clinical practice of transcribing dosage quantities of these preparations into terms of so-called cat units. In previous communications to *THE JOURNAL* (April 11, 1934, p. 1247) both C. W. Edmunds and H. A. McGinnis protested against this practice and advised that the cat should be left in the laboratory. That their protest was unconvincing seems apparent from the general literature and was voiced by Dr. Robert L. Levy in the answer to their communications. Since the current action of the U. S. Pharmacopoeia might be interpreted by some as a vindication of this usage of "cat units" in clinical parlance, it seems appropriate to recall and reemphasize the reasons why such terminology is unwise and even potentially dangerous. The risk which such usage entails comes from the inadvertent support which it affords to the notion that all cardio-tonic drugs which are assayed on cats, and for which "cat units" can therefore be computed, can be reduced to a single common denominator of therapeutic potency in terms of their "cat unit" equivalence. That a given number of "cat units" of one preparation does not necessarily have the same therapeutic potency is the same number of "cat units" of a different preparation is testified to by an abundant literature and can be confirmed by any one who consults the suggested dosages for the digitalis and digitalis-like principles and preparations in the current edition of *New and Nonofficial Remedies*. For example, the average oral daily dose of Tablets Digilamid is equivalent to 2 to 4 "cat units," of Tablets Digalen-Roche to 1½ to 3 "cat units" and of Tablets Gitaleu to ⅓ to 1 "cat unit." Obviously their cat unitage does not provide a common measuring stick on which to determine their therapeutic employment or interchangeability. It is equally obvious that disquieting effects might ensue if one substituted say 3 "cat units" of Gitaleu in treating a patient who was being maintained on 3 "cat units" of Digilamid or Digalen. Perusal of the clinical literature persuades one that such discrepancies, while widely recognized, are not understood, are confusing and are often interpreted as evidence of the frailties of the assayists and their assays.

The explanation of the necessary discrepancy between such units of biologic activity and therapeutic potency when dealing with unidentical agents can be simplified most readily by analogy. If both epinephrine and ephedrine were assayed as to their biologic activity by intravenous injection in dogs and then activities stated in terms of "pressor units," 10 "pressor units" of epinephrine given by mouth to a patient would not be the therapeutic equivalent of 10 "pressor units" of ephedrine, since the latter is readily absorbed while the former is not. If a long acting barbiturate (e. g. barbital) and a short acting barbiturate (e. g. pentothal) were assayed as to their biologic activity in animals and their activities stated in terms of "hypnosis units," while 10 "hypnosis units" of either might be equally effective and possibly interchangeable for the purpose of inducing sleep in a patient on a single occasion, they would have quite different effects if these doses were administered three or four times daily for purposes of maintaining sedation. In one instance a cumulative effect would be apparent, in the other probably not.

Although there are other ways in which the various cardio-tonic glucosides differ from one another, these two differences (absorbability and duration of action) are most significant in determining how they should be used for either rapid digitalization or maintenance. A method of biologic assay cannot dispel these differences. The purpose of the biologic assay is to assure

uniformity in potency from sample to sample of the same kind of a digitalis preparation and is not and cannot be a method of equilibrating different kinds of cardiac principles. These remarks are thus not a reflection on the cat method of assay, for it has been proved to be highly accurate and reliable for its proper purpose. Even if facilities permitted a human assay, the "man units" of one preparation would not necessarily be interchangeably equivalent with the "man units" of another. For example, if the "man units" should be defined as that amount of digitalis-like preparation required to "digitalize" an average adult with auricular fibrillation, it would probably require daily doses of about ⅓ to ½ "man unit" of digitoxin to maintain such digitalization, while it would probably require daily doses of ¼ to 1 "man unit" of strophanthin for the same purpose, since the former is disposed of slowly and cumulates, while the latter is disposed of much more rapidly.

Therefore, since transcribing therapeutic doses of the digitalis group of drugs into so-called cat units does not serve a useful purpose, increases the confusion of the unwise and may lead to a therapeutic misadventure for the unwary, it should be discouraged.

Northwestern University Medical School,  
Chicago

## ADAMANTINOMA OF THE TIBIA

*To the Editor*—Drs. Malcolm B. Dockerty and Henry W. Meyerding have presented a valuable study of adamantinoma of the tibia in *THE JOURNAL* (July 18, p. 932). I have been greatly interested in these apparent enamel organ tumors of the tibia and have had the opportunity of studying sections from the tumor reported by Bishop (*South M. J.* 30:571 [June] 1937). They appear to ape the enamel organ tumor but never seem as well differentiated as those occurring in the jaws. It is possible that those in the tibia are merely squamous cell carcinomas resembling the enamel organ tissues by some odd coincidence. It is even possible that the publication of Fischer's case in 1913 attracted attention to this oddity and led to the reports on the 16 subsequent cases between 1930 and 1941. Why should an enamel organ neoplasm select the tibia as its only site remote from the mouth and the orally derived pituitary tissue?

The authors say "We do not feel the necessity of postulating for the mandibular, maxillary, pituitary or tibial types the almost mythical occurrence of anatomic epithelial rests."

It is not necessary to postulate these rests in other than tibial regions. The periodontal membranes of the teeth are usually rich in epithelial rests (debris paradentaire of Malassez), which are derived from remnants of the enamel forming apparatus. McCrea (*J. A. Dent. A.* 24:1133 [July] 1937) found epithelial rests in the periodontal membranes contiguous with 59 per cent of 60 dental granulomas examined in serial section. In the remaining 41 per cent proliferating epithelium was found. This is hardly a mythical occurrence. Similarly in the case of the pituitary, remnants of Rathke's pouch are factual. It is not my contention that these neoplasms of the jaw and pituitary must be derived from epithelial rests but merely to point out the possibility of such an origin.

Dockerty and Meyerding object to the term "ameloblastoma" while admitting that "adamantinoma" is a misnomer. It is true that little will be gained by using this more correct term, but perpetuation of misnomers has prevented progress in many fields. The term "ameloblastoma" is used in Kronfeld's "Histopathology of the Teeth and Surrounding Structures" (ed. 2, Philadelphia, Lea & Febiger, 1939) and by the Registry of Oral and Dental Pathology of the Army Medical Museum.

ington University School of Dentistry

## CONSTITUTIONAL INADEQUACY

To the Editor—Dr Walter C Alvarez in his discussion of constitutional inadequacy in THE JOURNAL July 4 has rendered a distinct service in emphasizing the importance of this problem. It is no exaggeration to state that 30 to 40 per cent of patients who apply for treatment to the general practitioner or the medical consultant fall into the category of the 'constitutionally inadequate'. Yet if one peruses the medical literature year in and year out it is apparent that the attention paid to them is inadequate. Dr Alvarez's continued interest in and occupation with this problem and his insistence that we recognize these patients promptly and so save useless time and money and in many instances futile surgery is a notable exception to this lack of interest.

However one may agree with him as to the inherent incurability of the disease and the presence of a constitutional weakness of the nervous system it is my feeling that our therapeutic armamentarium is not necessarily limited to getting these patients to acquiesce in their symptoms, conserve their energies and limit their activities. From out of this great scrap heap of human rejects can be sorted out several groups which respond satisfactorily to medical treatment. A few of these types are listed by Dr Alvarez.

The most common group is the type of inadequacy in which digestive symptoms are prominent. These symptoms bear a striking resemblance to the complaints termed chronic gastrointestinal malfunction. Treatment of these patients with large doses of thiamine hydrochloride over sustained periods of time has proved successful in bringing alleviation of these symptoms and a distinct return of well being. My experience with this drug over the past few years serves to corroborate the findings of Borlock and his co-workers, C. L. Hartsock, Morgan and Barry and others.

Inadequate women at the time of the menopause with pelvic disturbances as mentioned by Dr Alvarez make up another considerable segment of this mass of patients. It is these who frequently border on the involutional melancholic stage and in whom migraine is not an unusual concomitant. I have found estrogenic therapy supplemented with thiamine hydrochloride effective in raising the level of well being in these instances.

Dr Alvarez aptly states that with all the best intentions in the world we are giving these patients a raw deal. These surgical derelicts with repeated hospital admissions who present themselves with four or five incisional scars are mute evidence of the inadequacy of our understanding of the problem. It is only when we are able to clear our medical thinking of the accumulated debris of the years—was glad to read of a surgeon recommending that the operation for abdominal adhesions be relegated to the dark ages of surgery—and apply intelligently the means of treatment at our command that we shall be able to justify the faith these unfortunates place in us.

JACOB LICHSTEIN, M.D., Philadelphia

## DEATHS AFTER USE OF MERCURIAL DIURETICS

To the Editor—The July 25 issue of THE JOURNAL contains a series of papers which serve to direct attention to the dangers incident to the use of mercurial diuretics. I wish to call attention to a possible source of misunderstanding.

Three of the deaths described in that issue of THE JOURNAL are reported in duplicate, i. e. 3 of the cases described extensively by DeGraff and Nadler are published elsewhere in the same issue by Brown, Friedfeld, Kissin, Modell and Sussman. The reader should therefore count these deaths as three rather than six. This situation arose unfortunately because we were not aware that personal inquiries concerning these cases by DeGraff were to result in a publication.

It is indeed important to point out the dangers of the mercurial diuretics but it is equally important not to overemphasize these dangers in view of the fact that these drugs constitute one of the most important groups of modern therapeutic agents.

WALTER MODELL, M.D., New York

## DIABETES MELLITUS AND PYOGENIC SKIN INFECTIONS

To the Editor—The statistical validity of the article by Dr John R. Williams entitled 'Does Diabetes Mellitus Pre-dispose the Patient to the Pyogenic Skin Infections?' published in THE JOURNAL April 18 seems highly questionable to me. I submitted the entire statistical calculations to the statistician in our Department of Preventive Medicine of New York University College of Medicine. He went over this material, and I am enclosing a copy of his letter to me.

SAMUEL STANDARD, M.D., New York

Dear Dr. Standard—First as to association between diabetes and skin infections the author submits data from four separate sources, namely, two hospitals, one group of patients from four general practitioners and one group of his own patients. For only one of these four groups are the figures complete and that group directly contradicts his statement. From these data it is obvious that there is no significant etiologic relationship between pyogenic skin infections and diabetes.

In the first group of 27,209 hospital admissions 0.64 per cent of the total number admitted were afflicted with boils or carbuncles, 2.42 per cent of the diabetic were so afflicted. The author indicates that he would wish to say that the higher percentage among the diabetic could be a tributed merely to normal variations due to chance. In my opinion however based on simple statistical rules if he was to make a study in ten thousand hospital groups similar to this one he could not expect to find one group showing such a high percentage for diabetic patients due to chance alone. This is considered good evidence that boils and carbuncles will appear more frequently among the diabetic than in the general population. I say this merely to point to the fact that an association between events based on numbers alone cannot always be regarded as evidence of a causal relationship.

As regards the second hospital group of 43,980 admissions there are no figures to indicate what percentage of the diabetic were afflicted with skin infections. I believe that it would be wise for us not to make assumptions regarding the percentage of diabetic patients in this hospital group.

Considering the four groups of patients only the first three give an indication of the incidence of skin infections in the general population. These are:

|                                    |               |
|------------------------------------|---------------|
| First hospital group               | 0.64 per cent |
| Second hospital group              | 0.67 per cent |
| The patients of four practitioners | 4.18 per cent |

On the other hand among the four groups of patients presented as evidence only two of them give even a rough indication of the percentage of skin infections among diabetic patients. These are:

|                                |                          |
|--------------------------------|--------------------------|
| First hospital group           | 2.42 per cent            |
| Group of author's own patients | approximately 4 per cent |

This last figure is again presumptive because the author states merely that among 500 patients there were thirteen occurrences of boils and seven of carbuncles and there is nothing to state that there may not have been certain patients with both boils and carbuncles.

Taking the percentages as I have listed them the 4.18 per cent afflicted among the patients of the four practitioners is a definitely higher figure than for the two hospital groups and it is of the same order of magnitude as the two figures for diabetic patients. This is the only point in the whole paper which might suggest that the afflictions with skin infections in a general population group could be as great as in a group of diabetic patients. However on this point there is no evidence that the different groups are comparable and I would call such an argument weak.

The second point of criticism is that the author's analysis of his 500 patients is not valid. Dr Williams states that he has seen some of his patients for more than twenty years. On this score he should consider the fact that if he observed a patient for twenty years he was twenty times as likely to observe a skin infection as he would be in a patient observed for only one year. This is the chief reason why his observation of his own 500 patients is in no way comparable with observations on hospital admissions.

A third criticism is the tabulation of the cases which he presents in the article. To begin with it is irrelevant since the distribution by sex for example is not considered anywhere in the article. Moreover he does not give the number of patients with boils and carbuncles but occurrences which in theory gives no basis for comparison with the other groups discussed. It is unfortunate that the author although he states that his findings support the opinions and conclusions of other workers does not give reference to these other workers.

AMERICAN BOARD OF RADIOLOGY. Oral. Chicago. Nov. 27-29. Final date for filing application is Sept. 30. Exam. Sec. Dr. Byrl R. Kirklin, 102 110 Second Ave. S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY. Part I. Oct. 7. Final date for filing application is Aug. 22. Exam. Sec. Dr. J. Stewart Rodman, 225 S. Fifteenth St., Philadelphia.

AMERICAN BOARD OF UROLOGY. January 1943 (tentative). Exam. Sec. Dr. Gilbert J. Thomas, 1409 Willow St., Minneapolis.

### Illinois April Report

The Illinois Department of Registration and Education reports the written examination (graduates of foreign and Canadian schools given also a practical test) April 7-9, 1942. The examination covered 10 subjects and included 100 questions. An average of 75 per cent was required to pass. Fifty-six candidates were examined, 40 of whom passed and 16 failed. The following schools were represented:

| School  | PASSED | Year Grad            | Number Passed |
|---|--------|----------------------|---------------|
| University of Colorado School of Medicine                                   |        | (1929)               | 1             |
| Chicago Medical School  |        | (1940)               | 1             |
| Loyola University School of Medicine  |        | (1941, 2), (1942, 2) | 4             |
| Northwestern University Medical School                                      |        | (1940), (1941)       | 14            |
| Rush Medical College  |        | (1941, 2)            | 2             |

### MEDICOLEGAL ABSTRACTS

**Malpractice Alleged Improper Application of Diathermy Treatment**—The physician defendant in the course of treating an injury to the plaintiff's left hand and arm recommended stated diathermy treatments. Accordingly the defendant Dyer, who was not a physician, applied in the physician's presence a diathermy treatment of the strength and duration prescribed by the physician. Some time later a treatment of the same strength and duration was again given. Apparently painful and permanent injuries resulted. The plaintiff brought suit against both the physician and the layman, charging that there was a joint duty on the part of both of them "to see that said diathermic treatment was properly administered and that the machine was properly operated and that the treatment was suspended and terminated at the proper time so as to prevent injury." It was charged that the defendants failed in this obligation and "carelessly and negligently caused an electrical current of an amperage specified and directed by (the physician) to pass from said machine through plaintiff's said left arm and hand for said period of twenty (20) minutes, although the said (physician) and (diathermist) knew, at the expiration of twenty minutes that the treatment was inflicting severe pain upon the arm and hand of the plaintiff."

The electrical current, the declaration charged, in both treatments was negligently applied under the negligent and careless personal supervision and direction of the physician, and the treatment lasted continuously for twenty minutes notwithstanding the remonstrances on the part of the patient that it was causing her great pain. A demurrer interposed by the physician was sustained and judgment was entered in his favor. The patient then appealed to the Supreme Court of Florida.

Each of the defendants, the physician and the diathermist, acted within a definite sphere, said the Supreme Court. It was the physician's responsibility to advise such treatment as is generally accepted by the profession as the one most likely to cure or relieve the particular injury from which the patient was suffering when she consulted him. It was the duty of the diathermist to apply the heat of a strength and duration designated by the physician. His duty was expertly to follow the instructions given by the physician. There was no claim that the remedy itself, that is the application of electrical current, was improper for one in the patient's condition nor that there was failure on the part of the diathermist to follow the prescription of the physician. Neither was there a charge that the machine was defective. The substance of the allegation is that the intensity of the heat, the duration of the treatment and the

repetition of it constituted negligence resulting in injury. There is in the complaint not only insufficient averment of facts showing negligence but also of facts indicating unity of design or violation of 'joint duty' owing, by both defendants. This is far from showing that there was a joint tortious act on the part of the defendants or concert of action between them which is necessary to fasten liability on them on the theory that they were joint tort-feasors. The patient contended that the allegations of the declaration abundantly show the characteristics of joint tort-feasorship, citing in support of the contention 2 cases, *Louville & A R Co v. Allen*, 67 Fla 257 65 So 8 and *Finstone v. Allison Hospital Inc*, 106 Fla 302 143 So 251 which held that it acts of negligence although distinct in themselves concur in producing an injury the persons guilty of negligence are joint tort-feasors and are jointly and severally liable for the injury. Even granting that rule, however, the court did not believe that it could be applied to the facts in the present case. Even granting, said the court, that the rule is in Florida that when the negligences of two or more persons concur in producing a single, indivisible injury, then such persons as joint tort-feasors are jointly and severally liable, although there was no common duty, common design or concerted action, we still are unable to discern in the pleading allegations which it proved would establish that there was negligence on the part of the physician in his field and on the part of the diathermist in his which concurred in the eventual injury. And the court was not influenced by the charge that the physician was present at the time of the treatment.

The judgment of the lower court in favor of the defendants was accordingly affirmed—*Hudson v. Highland*, 8 So (2d) 37 (Fla., 1942).

**Privileged Communications Hospital Records, Autopsy Reports, Interns**—An industrial life insurance policy provided, with certain exceptions not pertinent to the present case, that the insurer assumed no obligation if within two years preceding the date of the policy the insured had been a patient at or an inmate of any institution for the treatment of physical or mental disease or had undergone any surgical operation, or had been attended by any physician. The policy was issued April 11, 1938. About two months later the insured died in a hospital as the result of 'rheumatic heart disease with congestive failure'. The insurer denied liability the trial court directed a verdict for the beneficiary and the insurer appealed to the United States Court of Appeals for the District of Columbia.

To establish its nonliability, the insurer attempted to prove through a practicing physician that he had treated the insured at weekly intervals during the period between Dec 25, 1937 and June 6, 1938, the date of her admission to the hospital, and also to prove through the hospital intern the hospital records showing the history diagnosis and treatment of the insured. An effort was made, too, to introduce in evidence an autopsy report. These records if admitted, would have shown that at the time of the admittance to the hospital the insured had stated that since 1937 she had experienced shortness of breath and had tired easily that she had ceased working Jan 1, 1938 and had then consulted her family physician, who had treated her regularly thereafter that she had been in bed intermittently since January 1938, and that some years previously she had been treated for syphilis and for rheumatic heart disease and pulmonary tuberculosis. The trial court held this evidence to be inadmissible because of a statute providing that 'no physician or surgeon shall be permitted, without the consent of the person afflicted, or of his legal representative to disclose any information, confidential in its nature which he shall have acquired in attending a patient in a professional capacity and which was necessary to enable him to act in that capacity'. The correctness of this ruling was contested on appeal.

The trial court did not err in excluding the hospital records in the opinion of the court of appeals. The witness who was offered to prove the records an intern, stated that the information came from the lips of the patient. The duty of the witness in the hospital required him to obtain the information for the records and for the use of the attending physician. Counsel for the insurance company argued that an intern, not then licensed to practice, was not a physician within the meaning of

the privileged communications statute and therefore the information given him by the patient in response to his queries was admissible. The statute is very broad, the court pointed out. It forbids disclosure by the physician of any information obtained by him in his professional capacity. The intern is him in a physician the court said. He is a graduate of a medical school with a doctor's degree although he may not be licensed to practice his profession in the ordinary way by so holding himself out to the public. But it is common knowledge that a part of the duty of an intern is to get the medical history of a patient and in this respect he is the attending physician. Not only this, but in many instances he does the work of a physician and in other respects relieves the physician of professional services which he would ordinarily perform. It would be straining the law the court concluded, to hold that disclosures made to him by a patient are not equally privileged as those made to the physician in charge.

The trial court erred however in rejecting the testimony of the other physician who was asked to testify only to the fact that he had been called to attend and had attended and treated the insured in a professional capacity during the two year period immediately preceding the issuance of the policy. This testimony did not relate to any information secured by the physician from the patient but only to facts within his own knowledge and material to the insurance company's case that a fraud had been practiced by the insured in denying to the insurer that she had been previously treated by a physician. Error was committed, too in rejecting the evidence of the hospital records showing an autopsy on the insured. The competency of evidence of this character, the court pointed out, was decided in *Carmody v. Capital Traction Co.*, 43 App D C 245, Ann Cas 1916D, 706, in which it was said that the relation between a surgeon performing an autopsy and the body of the dead person is not the relation of physician and patient.

The judgment of the trial court was therefore reversed and the case remanded with instructions to grant a new trial—*Eurela-Maryland Assur Co v. Gray*, 121 F (2d) 104 (1941).

## Current Medical Literature

## AMERICAN

The Association library lends periodically to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1942 to date. Requests for issues of earlier years cannot be filled. Requests should be accompanied by stamps to cover postage of not more than 18 cents at three periods. They are regularly published by the American Medical Association and are available for lending but can be supplied on purchase order. Manuscripts are the property of authors and can be obtained upon return of the original.

Title marked with an asterisk (\*) are abstracted below.

**Myocarditis in Poliomyelitis**—During the last few years Saphir and Wile encountered 7 patients with poliomyelitis who died during the acute stage of the disease or suddenly (3 patients) several months after the acute process had subsided. At necropsy the hearts of 6 of these patients showed myocardial lesions. The myocardial changes in the 7 patients were characterized by foci of perivascular infiltration of lymphocytes and neutrophils. Monocytes were also present in some instances, and there was a multiplication of adventitial cells. Occasionally inflammatory cells widely invaded the interstitial tissue. Minute foci of lymphocytes were seen just beneath the endocardium. The muscle fibers showed little degeneration. Clinically, the myocarditis was not suspected. The length of time poliomyelitis had existed or its apparent severity had no bearing on the degree of myocarditis found at necropsy. From a review of the patients' clinical records no definite criteria can be laid down for the diagnosis of acute myocarditis in poliomyelitis, since it often runs its course without producing any diagnostic symptoms. Myocarditis should be suspected if the patient suddenly becomes worse and begins to fail rapidly without any apparent reason. Because of the extremely high incidence of myocarditis (6 of 7 patients) its occurrence during poliomyelitis should be borne in mind. Many patients with poliomyelitis, particularly of the bulbar type, die from bronchopneumonia, among the 7, 4 had pneumonia. The perivascular

infiltrations were not characteristic of rheumatic myocarditis, and the histories of the patients gave no indication of rheumatic fever. Herzog and Rodriguez, in their discussion of myocarditis in typhus, described among other cells the accumulations of adventitial cells around blood vessels and the rarity of degenerative changes. The changes they described were somewhat similar to those seen in the myocardium of some of the 6 patients with poliomyelitis. Whether or not this indicates that these myocardial changes are characteristic of virus diseases cannot be answered at present, but more careful studies of the myocardium of patients dying from virus disease may determine whether or not virus disease causes a definite, clear and characteristic myocarditis.

**Bilateral Renal Disease in Persistent Hypertension**—Of 1,000 patients who died of conditions directly related to hypertension and on whom necropsies were performed, Kahn and Laupply point out that all had a final anatomic diagnosis of arterial nephrosclerosis, arteriolar nephrosclerosis or a combination of the two. The renal vascular disease was bilateral in all, but in many the degree of vascular involvement was not the same in the two kidneys. The renal involvement can be so extreme as to produce a functionless or almost a functionless kidney. The weight and size of the kidneys of 456 patients were determined at necropsy, but neither was directly proportionate to the degree or duration of the hypertension.

**Sulfathiazole in Agranulocytosis**—Dameshek and Wolfson gave sulfathiazole in large doses to 2 patients with agranulocytosis in addition to transfusions and pentnucleotides. The ensuing recoveries of the patients may have been due, in part at least, to the effect of the sulfonamide on the sepsis which was almost certainly present, thus allowing spontaneous leukocytic regeneration in the bone marrow to take place. Sulfonamide drugs may be effective even in the complete absence of granulocytes. It is suggested that a further trial with sulfathiazole or sulfadiazine be made in other cases. When the condition is due to sulfanilamide, the use of sulfathiazole or sulfapyridine and vice versa might be considered.

**Lead Compounds for Polycythemia Vera**—In the treatment of 11 patients with polycythemia vera Falconer used acetate orally and colloidal lead phosphate intravenously for periods of from one to five years. Nine of them were relatively free from symptoms during treatment and were able to continue their work, but 2 with complicating thrombosis were chronic invalids and were unable to work. Treatment of such patients with lead is contraindicated. Up to the present time no permanent or serious toxic effects have occurred and there have been no deaths. Six of the 11 patients had previously received phenylhydrazine, which they regarded as more toxic and disabling than lead and were unwilling to submit to further treatment with it. Colloidal lead phosphate intravenously in doses of 10 cc controls the symptoms and reduces the blood level, but it should never be used unless the patient can be kept under careful supervision.

**Treatment of Tuberculous Women During Pregnancy**—Since September 1921 Mariette and his associates have followed 8 premature deliveries in 8 tuberculous women and 96 full term pregnancies in 86 tuberculous women. They directed their effort to the treatment of the disease process rather than against the normal physiologic process (pregnancy), believing that the tuberculous pregnant woman could go to full term without interfering with her recovery from tuberculosis. Sixty-four of the 86 women were delivered at the sanatorium and 22 elsewhere. Of the 82 followed up, 15 (18.3 per cent) are dead in contrast to 39.1 per cent of all women who were discharged from the sanatorium for the first time during the same period. If those having premature deliveries are considered, 19 (21.6 per cent) are dead in contrast to the 39.1 per cent for all women discharged from the sanatorium for the nineteen years of the study. While the group of tuberculous pregnant women is small, the length of the study gives it some value and seems to indicate that when tuberculosis is properly treated pregnancy probably does not adversely affect the disease. Many variables require further study before it can be explained why the death rate for all women between 18 and 39 years of age

following first discharge is approximately twice that of the pregnant group. Tuberculosis by itself does not necessarily constitute an indication for therapeutic abortion. The modern methods of treating tuberculosis and modern antepartum care apparently offer the tuberculous pregnant woman as good a chance for recovery from the tuberculosis as though pregnancy did not exist. A joint study by sanatoriums holding the same views might yield more conclusive data.

**Erythroblastosis Neonatorum**—Javert emphasizes certain obstetric features of erythroblastosis neonatorum as revealed by a study of 55 cases. The most prominent clinical feature is the type. Of the 55 cases 17 were hydrops fetalis with a fetal mortality of 100 per cent. The respective figures for the other types were for icterus gravis 27 with 45 per cent mortality, congenital anemia 4 with 25 per cent hemorrhagic diathesis 4 with 25 per cent and unclassified cases (without the four foregoing features) 3 with 100 per cent mortality. These last 3 infants died in utero and examination disclosed unmistakable evidence of erythroblastosis. The incidence of the disease is 1:438. The fetal mortality rate appears lower among infants born nearer term. Primiparas having such infants seem prone to have subsequent babies with the disease; the recurrence in multiparas is about 50 per cent. This points to a dominant mendelian characteristic inherited from the parents, the Rh factor. An intraplacental hematoma containing numerous normoblasts and erythroblasts most likely of fetal origin was found in 8 instances. Such a lesion provides for the transmission of the Rh agglutinin or some other factor from the fetal circulation to that of the mother. Thus isoimmunization of the mother could take place. The formation of antibodies in the mother and their passage through the placenta into the fetal circulation probably causes erythrocyte hemolysis and the hemosiderin pigment. The chief maternal complications were toxemia of pregnancy and excessive uterine enlargement. Early recognition of the disease in the delivery room aided by studies of the cord blood affords an excellent opportunity for prompt treatment. Microscopic studies of the placenta are confirmatory. Damage to the internal organs, particularly the liver, is borne out by pathologic and physicochemical studies.

**Treatment of Carcinoma of Cervix**—Scheffey and his colleagues saw 293 patients with carcinoma of the cervix between September 1930 and September 1936. Of these they treated 277 and followed up 97.2 per cent. Approximately 7 per cent of the lesions were classified as adenocarcinoma and the others as squamous cell in type. Freedom from signs and symptoms of cervical carcinoma for five years following treatment is in no sense a criterion of cure. The term salvage is used for patients who have survived for five or more years after therapy. The present day or absolute salvage (patients alive following treatment based on total actually seen), the

relative salvage (patients alive following treatment based on number actually treated) and the five year salvage (patients treated during the observation period who survived for five or more years but eventually died of carcinoma or an intercurrent condition) are respectively 129, 137 and 231 per cent. Five years ago the respective percentages were 19.2, 20.5 and 25.3. Ten years ago they were 14.2, 15.7 and 20.7. This tends to show that as survivors grow older the mortality rate is influenced by diseases incident to old age and not necessarily due to recurrent carcinoma unless definitely proved. The percentage of surviving patients more than 40 when they had received their initial treatment is about twice as large as the corresponding percentage of survivors less than 40. Of 5 patients with a group 1 lesion 2 are alive ten and twenty years, respectively. Eight of 30 patients with a group 2 lesion are alive from five to nineteen years. Of 208 with group 3 lesions 26 are alive from five to nineteen years. None of the 25 patients with group 4 lesions survived the five year period. Of the 19 with group 5 lesions 2 are alive eight and ten years after treatment. Four patients died primarily as a result of treatment. Pelvic peritonitis developed in 2 and the other 2, dying respectively on the eighth and twenty-first postoperative day, exhibited advanced cardiovascular and renal disease in addition to the pelvic changes of advanced carcinoma. Radium therapy was undoubtedly the factor in producing or at least in activating the virulent pelvic infection of the first 2 patients who died.

**Gestation After Induced Amenorrhea**—A diagnosis of submucous fibroid was made in a woman of 47 who fourteen years ago had a therapeutic radium amenorrhea induced. At operation Rosenberg and Schenck found the uterus smooth and enlarged to about a three months gestation; both ovaries were sclerotic and both tubes were normal. A supracervical hysterectomy and bilateral salpingo-oophorectomy were performed in the usual manner. The pathologic diagnosis was a gravid uterus with placental tissue and therefore the postoperative diagnosis was incomplete abortion. From the pathologic report (ovaries with evidence of follicular activity and recent corpora lutea) it was deduced that although no menstruation had occurred, cyclic ovarian function existed. Therefore, owing to some change in the hormone balance the ovaries had regenerated and had again become susceptible to the constant stimulation of the pituitary gonadotropes. This stimulation in time produced a suitable endometrium, so that nidation of the ovum and gestation ensued without previous cyclic bleeding.

**Pulmonary Coccidioidal Disease**—Peers and his associates limit their discussion of pulmonary coccidioidal infection to the clinical types in which pulmonary involvement is demonstrable and prominent. The port of entry may be the skin rather than the respiratory tract. Often cutaneous, meningeal, subcutaneous or osseous and articular lesions may develop without clinical or roentgen evidence of a pulmonary lesion. Even at necropsy a coccidioidal focus may be overlooked by any one other than an experienced pathologist on his guard. Many primary coccidioidal infections occur without demonstrable roentgen changes, even though proof through recovery of the fungus from the sputum cannot be challenged. Sometimes clinical symptoms are absent and the proof of infection lies in the change of the reaction to the coccidioidin test. It is extremely difficult to differentiate frank primary pulmonary coccidioidomycosis from tuberculosis on a clinical basis. Usually, as in primary tuberculosis, the infection is focalized. Occasionally a pulmonary cavity develops soon after the primary infection with few symptoms other than an occasional hemoptysis which

is not severe enough to endanger life or even health. Dissemination from this lesion is infrequent, even though the fungus may be present in the sputum. Rarely the fungus is not walled off and it disseminates, and then coccidioidal granuloma occurs as in endogenous reinfection. The maximal danger exists relatively soon after the infection is acquired, when every effort should be made to safeguard the patient.

**Lymph Nodes in Brucellosis**—Recently Wise and Poston reported isolation of *Brucella* from the lymph nodes of Hodgkin's disease. Bloomfield attempted to ascertain whether in true brucellosis there exists a clinical enlargement of lymph nodes. He had consulted eighty-six papers in English listed in the *Index Medicus* and found 30 cases in which the condition of the lymph nodes was specifically mentioned. Summary of the data reveals that lymph node enlargement is not uncommon. Even if it is assumed that the nodes were not enlarged in all the cases in which no specific mention was made, adenopathy was present in 152 per cent, when the state of the nodes was mentioned the percentage was 58. Study of the changes in individual cases, after making allowances for deficiencies of the data, indicates that in brucellosis enlargement of various superficial lymph nodes may occur as a specific manifestation. From this analysis it is not possible to show a clear relationship between glandular enlargement and the different varieties of *Brucella* or that there is convincing evidence of local regional adenitis in relation to the port of entry of the organism. In a number of instances the lesions appear to be specific Brucellosis, because of the prolonged undulating fever, palpable spleen, palpable lymph nodes and eosinophilia, may be easily confused with Hodgkin's disease and especially as the cellular reaction in the lymph nodes of *Brucella* infection may on occasion resemble that seen in certain cases of Hodgkin's disease.

**Dermatophytosis of Hands**—Systematic mycologic examination of 196 unselected patients with inflammatory lesions of the hands seen in private practice was instituted by Epstein, who demonstrated typical hyphae in 56 per cent and in 78 per cent of the 142 selected for treatment. The eruptions of these 142 patients could be divided into the following groups: 1 The squamous type cleared easily and showed no tendency toward recurrence. 2 The vesicular type responded rapidly but tended to recur. 3 The hyperkeratotic type was resistant to therapy. 4 There were also a few mixed and unclassified types. It is concluded that the diagnosis of dermatophytosis of the hands must rest on laboratory investigation.

**Tumors of Central Nervous System**—Peyton and Baker report 9 cases of epidermoid 1 of dermoid and 4 of teratoma of the central nervous system. They belong to the tumors of mixed tissue which arise from cell rests. When the neoplasm contains tissues from all three germ layers it is a true teratoma. When of mesodermal origin it is called a dermoid cyst and the epidermoid the most common is composed of only the ectoderm layer or tissue. The intracranial epidermoid is cured by surgical removal operation may be followed by aseptic meningitis the tumor may be calcified when it is in the lateral ventricle it produces a characteristic encephalogram from which not only is the tumor located but it is recognized as an epidermoid. Bilateral intraventricular cholesteatoma similar to that frequently found in the horse occurs also in the lateral ventricles of man. The following are the characteristics of dermoid and teratoma they are associated with dysraphia they are slowly progressive lesions of the cord or cauda equina and they produce by pressure erosion dilatation of a long segment of the spinal canal.

**Familial Mental Deficiency**—Jervis reports 6 cases of familial mental deficiency characterized by severe idiocy stunted growth characteristic facies and peculiar changes in the bones of the skull. He believes that these represent a new type. Pathologically there is ubiquitous swelling of the nerve cells with cytoplasmic infiltration of lipid granules. There are differences in this condition and in the juvenile amaurotic idiocy and gargoyism which appear to justify a separation of this type of mental deficiency. However the three conditions show obvious similarities which warrant their inclusion in the same group of diseases. In the pathogenesis of this condition the morbid process is considered an instance of localized lipodosis. Etiologically the disease is believed to be genetically determined and probably inherited through recessive genes.

**Disturbances in Brain Function Following Shock Therapy**—Electroencephalograms (global recordings of brain potentials) were recorded by Levy and his associates before the first convulsive shock treatment and at varying times up to several months after treatment of 23 patients was discontinued all but 4 of whom were suffering from primary or secondary affective disorders. Of the 4 2 were schizophrenic 1 was paranoid with depression and 1 was schizophrenic with no significant disturbance in mood. In all the patients evidence of neurologic disease was absent. Sensorial and intellectual disturbances of the organic type were absent in all before treatment. The presence and extent of post-therapeutic disturbances in cerebral function were determined. Fourteen of the patients recovered or improved and 9 had early relapses or did not improve. Evidence of disturbed cerebral function indicated by changes in the electroencephalogram and by changes in intellectual function was present respectively in 50 and 45 per cent. Signs of epileptoid disturbances (3 per second waves bicuspid and dicrotic waves spike and wave formations and greatly increased amplitude) were evinced in the electroencephalograms of the most severely affected patients. The post-therapeutic clinical evidence of impaired cerebral function consisted

of an 'organic' type of sensorial and intellectual impairment. Recovery from these disturbances usually occurred in a few weeks, in the more severely affected patients sometimes in as long as six months. Clinical recovery or improvement was apparently not dependent on the presence of these electroencephalographic changes.

**Nasal Sinusitis**—Shannon calls attention to the fact that orthostatic or postural albuminuria in children is a frequent accompaniment and apparently a result of nasal sinusitis especially of a subacute or chronic type. Therefore such albuminuria must be viewed with much more concern than has been the custom heretofore.

**Urticaria and Other Dermatoses**—Since his first report in 1939 on the use of histaminase for various dermatoses, Laymon has continued to use the drug and now adds the following data. Of 35 cases of urticaria, 21 were clinically cured and 14 were not benefited. There was no appreciable improvement in 7 cases of acne vulgaris in 2 of dermatographism or in 11 of atopic dermatitis and the light sensitization dermatitis of 1 patient definitely improved. The daily dose varied from 60 to 120 histamine detoxifying units. The urticaria or the patients selected for treatment was of relatively long duration and had proved refractory to the usual therapeutic measures.

## Schweizerische medizinische Wochenschrift, Basel

- Demonstration of Tubercle Bacilli in Direct Smears with Osol Staining in Dark Field as Method of Choice H. Eglh—p 166

**Conservative Cure of Renal Tuberculosis**—According to Hoffmann cure of renal tuberculosis by a conservative regimen is generally denied. Circumization of tuberculous foci with preservation of kidney function has been observed only twice and in 1 of these cases exact anatomic study had not been made. Aside from the autophrectomies in which auto-exclusion of the diseased kidney may take place there may occur intrarenal shutting off of tuberculous foci. Both processes may simulate a clinical cure since in either case the tuberculous focus is shut off from the renal pelvis and the discharging renal passages. Pyuria and tubercle bacilli disappear from urine, and the tuberculous lesions in the bladder subside. The subjective condition of the patient may improve to such an extent that a cure is assumed. Clairmont and Schaffhauser observed 3 such cases in which the encapsulated foci gave rise to fresh tuberculous dissemination three years later. These authors advocate the removal of such foci even in the absence of symptoms. Hoffmann believes that such temporary exclusions of tuberculous foci in the kidney are extremely rare. He reported in 1925 a case of renal tuberculosis in which a cure had been obtained under conservative treatment. The man had rejected a suggestion for the removal of the right kidney in 1920 and had been placed on a conservative regimen of sun baths, fresh air and tuberculin injections. He felt well in 1921 and the urine was free from tubercle bacilli. In 1924 tuberculosis of the left epididymus was detected but the urine and bladder were normal. The left testis and epididymus were removed following which the genitourinary apparatus appeared to be free from lesions. In 1926 the man developed pulmonary lesions and in 1932 bladder symptoms recurred and tuberculosis of the prostate was discovered. While the bladder urine was positive the renal urine remained negative suggesting that the bacilli in the bladder urine had their origin in the prostate. Following treatment at a sanatorium the symptoms subsided and the patient felt comparatively well. Later examination indicated that the pulmonary lesions had healed. Examination of the bladder urine in 1938 indicated that the tuberculosis of the prostate had healed. Clinically the patient is free from symptoms at the age of 71. The author agrees with Wildbolz that a cure of renal tuberculosis cannot be proved without an accurate anatomic study. He believes that in his case intrarenal exclusion is perhaps more likely than a cure. It is also apparent that the tuberculous infection was of an extremely mild type.

**Demonstration of Tubercle Bacilli**—Eglh points out that Osol in 1927 described a staining method with thick smears which yielded much better results than the Ziehl-Neelsen method. Hagemann in 1937 recommended fluorescence microscopy for the demonstration of tubercle bacilli demonstrating that the method was much more effective than the Ziehl-Neelsen method. Pothmann found that the results with fluorescence microscopy could be paralleled by the dark field method utilizing the Osol staining instead of the Ziehl-Neelsen. He demonstrated the great superiority of the Ziehl-Neelsen dark field method over the Ziehl-Neelsen light field method but found that in the dark field Osol's stain is superior to Ziehl-Neelsen's. Eglh reports his own comparative studies on 310 specimens (sputa, laryngeal, gastric, pleural, urinary and pus specimens). He concludes that 1. The expensive and relatively difficult fluorescence method can be used for the demonstration of tubercle bacilli only in scientific institutes. Its

results are not better than those obtained with the Osol stain in the dark field method. 2. The Osol dark field method is six times more accurate than the ordinary Ziehl-Neelsen method in regards the detected number of bacilli and as regards the time factor. 3. The dark field equipment requires few installations and is only about one tenth as expensive as is the fluorescence equipment and is easy to handle. 4. Osol's staining technique is simple and resembles the Ziehl-Neelsen method.

## Revista de la Asoc. Med. Argentina, Buenos Aires

56 125-182 (March 15 30) 1942 Partial Index

- Local Sulfanilamide in Surgery A. Wybert and L. A. Cslenghi—p 149

**Cervicodural Sympathogonioma in the Child**—Cibils, Acquirre and his collaborators report the case of a child 3 years old with symptoms of progressive compression of the spinal cord. Roentgenography revealed a tumor in the upper portion of the vertebral canal. At the operation an intradural tumor compressing the first, second and third segments of the spinal cord was found. There were no metastases. The tumor was free, isolated and encapsulated in fibrous and connective tissue containing neoplastic cells. Compression of the cord resulted in death early in the course of the development of the tumor. Microscopic study revealed that the tumor was a sympathogonioma. The authors believe that their case is the first of this localization and type.

- Allergy in Tuberculosis Local Leukocytic Formula in Normal and Desensitized Skin J. Zapatero Dominguez and E. Lopez Gutierrez—p 609
- \*Supernumerary Cervical Ribs T. Cervia and J. de la Rosa—p 627
- Pathogenesis and Therapy of Pulmonary Perforation E. Regli Fernandez—p 642

**Cervical Ribs**—Cervia and de la Rosa studied 1,678 roentgenograms of the thorax of persons of either sex, who were observed in an antituberculosis dispensary. Cervical ribs were found in 115 (47 men and 68 women). The abnormality was unilateral in 22 and bilateral in 93. Six unilateral ribs were on the right side and sixteen on the left. The bilateral ribs were of the same size on both sides in 65, the right rib was longer than the left in 15 and the left was longer than the right in 11. The abnormality was found in 24 children, 44 persons between 11 and 20 years of age, 23 persons between 20 and 30 years of age and 23 between 30 and 50 years of age. None of the patients complained of symptoms. The abnormality was familial in 3 instances: a father with a unilateral cervical rib with 3 children with bilateral cervical ribs, 2 children (brother and sister) with bilateral cervical ribs and 4 adult brothers with either unilateral or bilateral cervical ribs.

- Sulfanilamide Derivatives and Supplementary Therapy of Epidemic Meningitis G. Saker—p 116
- \*Treatment of Erythema Nodosum J. Simon—p 142

**Treatment of Erythema Nodosum**—Simon reports the clinical history of a girl aged 22 who five days before entering the hospital developed an eruption on the legs, fever and chills. Examination revealed cutaneous infiltrations 38 mm in size and bluish red discolorations on the legs and later on the arms. The disorder was diagnosed as erythema nodosum. Dietetic treatment and medication with acetylsalicylic acid had no effect. Further efflorescences developed. Azosulfamide was given and after two days or this therapy the erythema became paler and disappeared completely after four days. Five days later the patient could get up and had no more complaints.

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT NECESSARILY REPRESENT THE OPINION OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THE EDITOR WILL BE OBLIGED TO Omit It.

### DIFFERENTIAL DIAGNOSIS OF DERMATOPHYTOSIS

To the Editor—With the approach of warm weather I believe most physicians will be confronted with foot fungus cases to handle. I should like to know what efficacious medication we possess in treating cases of dermatophytid complicating epidermophytosis. I have been able to control the latter with common fungicides but the pruritic papulovesicular dermatophytid eruption has been a terrible task to ameliorate. Just what is the proper way to handle such cases? I have also noticed cases of dermatophytid in which close investigation of the toes did not reveal any fungous infection. How do you explain such a phenomenon?

A. S. Catinello MD Mechanicville N. Y.

ANSWER—The intensely pruritic papulovesicular eruption mentioned is probably not a dermatophytid. It seems too itchy and too resistant to treatment. The trichophytids and tinea secondary to scalp involvement often clear up spontaneously when the original focus of infection improves. A more likely explanation is that the eruption complained of is a secondary allergic dermatitis due to the drugs used in treatment, a contact dermatitis. If the lesions composing it are small and superficial the vesicles easily ruptured leaving weeping surface this is probably the case. Naturally the emollient drug or other strong fungicides will only increase the distress of the patient. Such sensitization takes place frequently after treatment of dermatophytosis. Soothing applications such as Burow's solution 6 to 10 per cent in water applied as cool wet dressings are indicated until the oozing ceases. Then a calamine lotion made with rose water in place of lime water can be used or zinc paste without salicylic acid. Soap and water should be avoided. The patient should cleanse with oil whenever necessary but it is not often necessary. He should use the utmost gentleness in applying the lotion or paste and in cleansing or rubbing is apt to cause renewed itching.

It is not rare to see cases with an eruption clinically indistinguishable from dermatophytosis of the feet and hands in which no fungi can be found by direct microscopic investigation or the scales or vesicle roofs. Some of these will show fungi by culture others will not. All writers on the subject seem to agree that when the hands are involved which is often the case, fungi are rarely found in the hand lesions. Cases are on record in which fungi were found on one foot not on the other, though both were diseased. Pompholyx, first called cheiro-pompholyx by Hutchinson is a disease occurring usually on the feet and hands clinically and histologically identical, except for the absence of fungi with the disease called dermatophytosis of the feet and hands. The difficulty in explaining the fact that an eruption of the feet caused by fungi is often succeeded by a similar eruption on the hands in which no fungi are found was explained by Bloch as an original focus of fungous infection succeeded by a dermatophytid on the hands. With this view S. L. Peck (Epidermophytosis of the Feet and Epidermophytids of the Hands *Arch Dermat & Syph* 22:40 [July] 1930) is in full accord. He quotes three possible explanations offered by Bloch and Walthard.

1 The fungi may be saprophytes growing in an eruption of an entirely different etiology. This Peck discards because of the well established pathogenicity of many of these fungi the beneficial effect on the disease of fungicidal and fungistatic drugs and the experiments of von Graffenried and of Peck in which they caused typical outbreaks by infection with cultures of some of the fungi commonly found in the disease.

2 Epidermophytosis on the feet combined with a different disease on the hands dyshidrotic or eczematoid. This is not likely because the percentage of cases in which both areas are involved is entirely too high for coincidence. There must be a direct relation between the disease of the hands and that on the feet.

3 The lesions on the feet are primary those on the hands secondary (epidermophytids). Von Graffenried first demonstrated that all cases of ringworm of the feet show a positive reaction to trichophyton. Peck obtained from the blood of 1 patient cultures of one of the fungi present in the lesions on the feet.

Peck's argument is a strong one, and his view has been accepted by most American dermatologists, but it has not been proved conclusively. It seems much easier to accept the first

of Bloch's postulates that the disease is pompholyx. The fungi are those already present in the skin of the feet, taking on new growth when the epidermis becomes more succulent under the influence of the pompholyx. The hands show no fungi because conditions there do not favor infection with fungi. Support for this position has been given recently by Sulzberger, Bauer and Hecht (Common Fungous Infections of the Feet and Hands *Arch Dermat & Syph* 15:670 [April] 1912) who show that the infection present on the feet is seldom passed to other persons even by the most intimate contact. The groom infections are nearly all autoinfections from the feet on the feet. Nearly every one of us has such feet remaining dormant for years. One must acknowledge that many of these fungi are potentially pathogenic but that does not prove their etiologic relation to the disease under discussion.

### RHEUMATOID OR ANKYLOSING ARTHRITIS OF SPINE

To the Editor—A man aged 33 has had ankylosing spondylitis for several years. Attempts at treatment with a great variety of vaccines injections and medicines have been unsuccessful. In October 1941 his hemoglobin was 36 per cent. After three blood transfusions his hemoglobin was 57 per cent and his red cells 4,267,000. Two more transfusions raised the hemoglobin to 68 per cent. Finally it reached 80 per cent but is now falling. He states that the higher his hemoglobin the more pain he has in his legs and back. Any suggestions would be appreciated.

C. Kenneth Cook MD St. Paul

ANSWER—Ankylosing spondylitis usually starts as a destructive arthritis of the sacroiliac joints with juxta articular osteitis. Its cause is unknown. It affects men, chiefly young men in a ratio of about fourteen men to one woman. As it progresses it produces painful spasms of the vertebral muscles, calcification of the vertebral ligaments (eventually producing the so called bamboo spine in roentgenograms) and arthritis of the apophyseal joints. In time notable spinal kyphosis and fixation of the chest wall may result unless appropriate therapeutic measures are taken. Involvement of peripheral joints is rare but involvement of the hips and shoulders may occur, the latter is usually periarticular (muscular) rather than intra-articular, however, the joint structures themselves may be affected.

Some students of arthritis attempt to distinguish ankylosing (rheumatoid) spondylitis from rheumatoid arthritis involving the spine. In the latter there is rheumatoid arthritis of the apophyseal joints and often of the peripheral joints, subcutaneous fibrous nodules (absent in ankylosing spondylitis) may occur but there is no ligamentous calcification, and the sacroiliac joints may or may not be affected (as they almost always are in ankylosing spondylitis). This distinction may be a real one but has not been accepted generally, at any rate the treatment of the two varieties is about the same.

The orthodox treatment of rheumatoid spondylitis involves the removal of obviously infected foci, daily use of professional or home physical therapy, perhaps fever reactions (typhoid vaccine) to induce lessening of muscular spasm, the use of postural and other spinal exercises, rib stretching and deep-breathing exercises to prevent or correct impending fixation of the chest and spine, the use of a bed with a firm mattress and a beaver board under the mattress to keep the spine straight at night, the use of one small or no pillow under the head, the use of a pillow between the scapulas or in the lumbar region for short periods during the day and night if kyphosis is developing. The patient may gain encouragement by making a monthly record of height and chest expansion. In selected cases the use of a Taylor brace during the daytime and a plaster shell or convex frame during the night gives considerable relief from pain and helps to prevent or correct the forward bending spinal deformity.

Recently Swain (*J Bone & Joint Surg* 21:983 [Oct.] 1939) proposed the following plan: preliminary correction of spinal deformity by hyperextension in bed for two weeks, then the application of a plaster jacket for early, continuous and adequate immobilization. Jackets were left on for weeks and replaced by new ones as the posture improved, they were worn by 62 patients for from several months to nine years. Swain reported that muscular spasm and pain were relieved rapidly, sleep was improved greatly despite the jacket deformities, were prevented or improved notably and expansion of the chest and weight increased.

Chrysotherapy (injections of gold salts) has given disappointing results. Still more recently Freyberg and his colleagues at Ann Arbor, Mich. recommended roentgen therapy as the remedy of choice to relieve pain (*The Journal* Sept. 6, 1941 p. 826). Unfortunately roentgen therapy has not given relief to the patient in question.

It extensive ligamentous calcification has occurred it may be impossible now to obtain satisfactory correction of the spinal position by orthopedic and other measures, but if such calcifications are still absent, localized or minimal, much of the deformity may be due to correctible muscular spasm. Hypochromic anemia is a characteristic feature of most cases of rheumatoid arthritis or spondylitis. Its exact cause is not known but distinguished hematologists (Munot, G. R. *New England J Med* 208 1285 [June 22] 1933; Haden, R. L. *Arch Phys Therapy* 21 671 [Nov] 1940) have registered their inability to influence it materially by the usual measures for anemia. The idea 'correct the anemia and the arthritis will improve' is fallacious. The anemia will lessen when the arthritis improves and probably not much before that time, hence no mordant therapy need be directed against the anemia, an adequate diet, perhaps with ferrous sulfate as a supplement, and occasional transfusions are all that need be prescribed for the anemia. Acetylsalicylic acid is the safest and generally the most effective analgesic. Aminopyrine and euclophen or neocinchophen are often effective substitutes, but one must be warned that granulocytopenia or euclophen hepatitis occasionally results. Aside from the use of analgesics, pain may be relieved by the physical and orthopedic methods already mentioned.

This disease varies greatly in its duration and the speed of its progress. It may stop after a few months or it may progress slowly for years. The average duration of symptoms is about five to seven years. After the active disease stops, only painless residues remain. In a great many cases the spine may be stiff, but it it has been led to stiffen with the patient in the straight posture the resultant economic and physical disability may be very moderate.

#### TOXICITY OF NITROGLYCERIN

To the Editor—I wish to ask for information or an available source of information regarding the industrial hazards and problems arising in workers in nitroglycerin. I have the ordinary care of employees in a powder plant and am confronted with the problem occasionally. I have been unable to find adequate reference to the literature of the past few years relative to this subject. I should like to ask the following questions: 1. What, if any, are the hazards to the circulatory or other systems of the body to long exposure to nitroglycerin? 2. What are the physical and other clinical findings of overexposure to nitroglycerin? 3. What, if any, are symptoms and signs of an accumulative action of nitroglycerin? 4. Are there any special clinical examinations indicative of circulatory damage from nitroglycerin? 5. In case of overexposure to nitroglycerin, what are the proper therapeutic measures? What physical standards should be adhered to in examinations of persons intending to work in nitroglycerin? Any help that you may be able to give on this subject will be sincerely appreciated.

A. N. Shaun, M.D., Bensan, Ariz.

ANSWER—Nitroglycerin, as employed industrially, is exquisitely toxic. The threshold for producing symptoms is so low as almost to defy measurement. The mere standing near a workman with traces of nitroglycerin or nitroglycerin powder on his body or clothing is quite sufficient to induce prompt manifestations. The commoner features are headache, throbbing in the head, palpitation of the heart, nausea, vomiting and flushing. The headache may be violent and may be associated with acute mania. This results from dilatation of the blood vessels about the brain, notably those of the meninges. This gives rise to such jargon terms as "dynamite head" or "powder headache." Always alcoholic drinks precipitate attacks and increase their severity. Nitroglycerin in industry commonly enters the body through inhalation of its vapors or through skin absorption. The families of workers may suffer from typical attacks shortly after the return to the home of nitroglycerin workers unless change of clothing and other precautions are carried out. Habituation is readily established, but this tolerance may disappear in as short a period as two days away from work. Nitroglycerin poisoning in industry is a characteristic "Monday disease." Although a few drops (3 to 5) may produce a fatality when taken internally, increases in exposure such as from 1 to 30 mg may not produce highly different results. It may be doubted that any chronic type exists, although such forms have been described. No organic changes are known to arise in the heart, central nervous system or the eyes, although temporary blindness is common. The depressed blood pressure may return to normal within one hour after elimination of exposure. The disposition of compensation courts ordinarily is to deny any claims specifying prolonged disability. The enumerated questions of the general query are now answered.

1. Quick exposure rather than long exposure appears to be of greater significance.

2. Already answered.

3. Apparently there is no cumulative action of nitroglycerin.

4. In addition to features already mentioned, significance should be attached to low blood pressure and to polyuria. Occasionally ulcers about the fingertips arise, so that the fingers should be examined.

5. In instances of severe poisoning, oxygen should be administered along with intravenous saline solution and saline cathartics. Workers should be taught to preserve their habituation when away from work by carrying a few grams of powder under their armbands or somewhere about their person. However, this step is troublesome for members of the family and others about the worker. The only known cause for rejection of an applicant for nitroglycerin work apart from the usual causes for rejection is alcoholism. The following literature items furnish further data.

#### PREMATURE GRAY HAIR

To the Editor—A married white man aged 29 has recently developed loss of pigment of the nasal and temporal margins of the eyelashes of upper lids of both eyes. The central portions of these eyelashes are as yet uninvolved. Now this process is beginning to appear at the nasal port of the right eyebrow. The hair on the head is entirely free of this loss of pigment and there is considerable hypertrichiasis of the body which also is uninvolved. There are some isolated pubic hairs which are white, obviously of recent acquisition. The history and physical examination are entirely negative; there is no evidence of any glandular or vitamin deficiency. Diet has been ample in all requirements. Can you suggest a diagnosis, etiology and treatment? Would para-aminobenzoic acid or the B complex be of any value, and, if so, what would be the proper dosage and where may the acid be obtained?

M. D., Maryland

ANSWER—Premature graying of the hair is an old problem without solution as yet. It is hard to explain the eccentricities of its occurrence, as in the example cited in the query. It is a familial peculiarity in many instances and in others is thought to result from nervous disturbances. It has long been suspected that deficient nutrition of nerves is a factor in its causation.

The vitamin studies which produce graying in animals and then cure it by correction of the diet have been made on mice, rats, dogs and silver foxes. By shaking a watery solution of liver extract, yeast or rice bran with fullers' earth the thiamine, riboflavin and pyridoxine are removed, leaving a solution of the "filtrate factor." Animals fed with a diet containing the other vitamins but lacking this factor soon show patches of fur that has become gray and thinned, ulcers sometimes appear on the tail or hind legs, the animal's skin becomes wrinkled as in old age, it becomes feeble, and it often dies within a few months if kept on the deficient diet. On adding the "filtrate factor" to the diet these symptoms clear up in most cases.

It is known that this factor contains pantothenic acid and para-aminobenzoic acid, but the effort to determine which of these is responsible for the prevention of graying has not been successful as yet, for there is disagreement among the research workers engaged in the problem. Ansbacher and his associates find that the lack of para-aminobenzoic acid causes the graying and that adding this vitamin to the diet restores the color of the depigmented patches. (Role of Para-Aminobenzoic Acid in the Vitamin B Complex—Studies with Mice, *Proc Soc Exptl Biol & Med* 48 118 [Oct] 1941). Others (Emerson, G. A. Failure to Cure or Prevent Graying of Rats with Para-Aminobenzoic Acid, *ibid* 47 448 [June] 1941, Unna, Klaus, Richards, Grace V., and Sampson, W. L. Studies on Nutritional Achromotrichia in Rats, *J Nutrition* 22 553 [Dec] 1941) have succeeded in producing the gray spots by depriving the animals of pantothenic acid and have then cured the animals by adding this vitamin to their diet. It has been suggested that there may be other vitamins as yet undiscovered in the "filtrate factor."

Apparently there are only two articles in the medical literature dealing with the effects of vitamin B Complex and para-aminobenzoic acid on human hair. They are both by B. F. Sieve (Clinical Achromotrichia, *Science* 94 257 [Sept 12] 1941, The Clinical Effects of a New B Complex Factor, Para-Aminobenzoic Acid, on Pigmentation and Fertility, *South Med & Surg* 104 135 [March] 1942). When vitamin B complex was administered to 9 patients who were under treatment for endocrine dysplasias the gray hair of all, he reports, became noticeably darker. He then began the use of para-aminobenzoic acid for the same purpose, giving it to those on treatment with endocrine preparations and also to many who were on no other treatment. In his second paper he reports over 800 cases treated in this way. Within three to eight weeks of treatment

with the vitamin the gray hair became dirty yellowish and then dark dusty gray.

These reports justify skepticism. As far as his articles show, Stevens only evidence of color changes was his visual impressions. The few who have tried to judge slight color changes in the skin or hair realize how easily one can be deceived.

The question of the possible harmful action of para-aminobenzoic acid in large dosage must be considered. Several investigators have shown that this substance interferes *in vitro* with the bacteriostatic action of the sulfonamide drugs on pneumococci and staphylococci and that it promotes the growth of *Streptococcus pyogenes* (Spink W. W. and Jernster J. *Effect of Sulfonamide Compounds on Growth of Staphylococci in Presence and Absence of para-Aminobenzoic Acid* *Proc. Soc. Exper. Biol. & Med.* 17:95 [June] 1941). Experiments on human beings with large doses of para-aminobenzoic acid should not be made until it is known what such interference with the bacteriostatic action of the sulfonamides signifies in the animal body.

### DISSEMINATED LUPUS ERYTHEMATOSUS

To the Editor—I should like your suggestions as to the diagnosis and treatment of acute lupus erythematosus disseminatus. What is known concerning the etiology of this condition and what measures best control the symptom complex?

G. H. Miles M.D. Gollitzin Pa.

ANSWER—The cause of this condition is not definitely known. Foci of infection either streptococcal or tuberculous may be underlying factors. The disease may follow the chronic discoid type or may occur as a primary acute systemic disorder. When it occurs as such, it is often difficult to diagnose.

The following symptoms commonly occur in the primary acute type: (1) edema of the face with an eruption on it resembling a severe toxic erythema or an erysipelas; (2) the presence of purpuric or erythema multiforme like lesions on the hands, arms and various portions of the body; (3) erosions on the mucous membranes and glossitis; (4) joint pains; (5) fever of a septic type; (6) enlargement of lymph nodes; (7) leukopenia generally; (8) albuminuria; (9) a pritchy or diffuse alopecia and (10) in terminal cases profound intoxication and delirium.

The disease has a high mortality, approximately 90 per cent. Fatal termination is generally due to pneumonia or nephrosis.

The treatment between attacks should consist of rest, avoidance of exposure to the sun, quinine by mouth and cautious removal of suspected foci of infection. During attacks the patient should be kept in a quiet dark room, symptomatic therapy should be given for the symptoms that develop and blood transfusions and sodium thiosulfate intravenously may be administered.

The sulfonamide group of drugs may be tried but so far they have not proved to be successful. In a few instances enough improvement has followed their use to warrant further trial.

### VAGINAL HYSTERECTOMY—WEIGHT OF NEWBORN

To the Editor—I would appreciate any information on the following: 1. Who performed the first vaginal hysterectomy in America and when? 2. What is the greatest authentic recorded weight of any newborn infant successfully delivered vaginally in this country? I find that Dr. O. O. Burgess of California delivered an 18 pound (8.2 Kg.) child in 1875. He appears to have accurately weighed and measured the newborn infant (*Pacific M. & S. J.* 9:179 1875). Has this feat been excelled?

T. Richard Hoffmann M.D. Berkeley Calif.

ANSWER—1. The only vaginal hysterectomy recorded in the American literature as having been performed prior to 1850, and therefore presumably the first vaginal hysterectomy performed in this country, is credited to Dr. J. Collins Warren. The date given is 1829. This reference is given by Dr. A. F. Lash (*Am. J. Obst. & Gynec.* 42:452 [Sept.] 1941).

2. The largest newborn child delivered vaginally in this country that is recorded in the literature (Belcher D. P. *A Child Weighing Twenty-Five Pounds at Birth* *THE JOURNAL* Sept. 23 1916, p. 950) was delivered by Dr. D. P. Belcher of Sale City, Ga. This was a 25 pound (11.3 Kg.) stillbirth. The type of scale used was not described. Koff and Potter in a recent article (Koff, A. K. and Potter, E. L. *Am. J. Obst. & Gynec.* 38:412 [Sept.] 1939) state that they were unable to find any authenticated instance of a living baby with a birth weight of 15 pounds (6.8 Kg.). However in a discussion of this paper before the Chicago Gynecological Society, Dr. John A. C. Busby reported (*ibid.* p. 422) a delivery at West Suburban Hospital of a baby weighing 16 pounds 3 ounces (7.4 Kg.). The infant was weighed on a certified beam scale and was living and well.

### REFRACTORY URINARY TRACT INFECTION

To the Editor—Two months ago a man who had an infected bladder from a large prostate had a transurethral resection (by a competent specialist) which seems to have relieved the obstruction. His urine is loaded with pus, the bladder capacity is about 50 cc. and he voids every half hour. The nonprotein nitrogen is 37.4, the blood pressure 142 systolic and 88 diastolic. The trouble seems to be local. Will you outline a proper method of treatment as what I have used has seemed so ineffective?

Mervin T. Sudler M.D. Lawrence, Kan.

ANSWER—First attempts should be made to eradicate the infection of the urinary tract. Toward this end a specimen of catheterized urine should be examined by means of Gram's stain and culture; several samples of urine should be examined for the tubercle bacillus. Suitable chemotherapy should then be instituted and the particular drug to be employed will depend on the type of bacteria found. A member of the sulfonamide group or mandelic acid will be most efficacious. Vesical lavage with potassium permanganate (1:8,000) may also be carried out. The presence of residual urine should be determined and in order to exclude urinary calculi, a plain roentgenogram of the urinary tract should be made.

If the patient fails to improve under this regimen a short course of prostatic massage should be given. Then if improvement does not result it will be necessary to carry out further urologic investigation. If an excretory urogram fails to reveal any lesion of the upper part of the urinary tract, cystoscopy should be performed. Careful search for urethral stricture, vesical calculi, interstitial or tuberculous cystitis, persistent infected prostatic tissue and diverticula should be made and proper therapy instituted.

### DERMATITIS VENENATA CAUSED BY ROACH POWDER

To the Editor—A woman aged 65 while engaged in cleaning came in contact four months ago with a green paste which had been spread on a potato for the purpose of killing roaches in an apartment house. The paste is known as J. O. Roach Paste, is manufactured by John Opitz Inc. 50-14 Thirty-Ninth Street Long Island City N. Y. and has as its content 1.375 per cent phosphorus plus inert material. Three weeks after contact there was an ulcer the size of a dime (18 mm.) situated below the inner malleolus of the left ankle. There was considerable erythema and vesiculation of the entire ankle. She complained of itching especially on the flexor surfaces of arms and legs and on the neck. This resembled the milder form of dermatitis venenata. It disappeared with the use of 1 cc. of epinephrine hydrochloride subcutaneously. The blood count was normal. The blood Wassermann reaction was negative. The patient continued to have flare ups of generalized pruritus and erythema especially about the antecubital fossa and a papulovesicular dermatitis on the left leg and foot. The blood sugar was negative. Repeated tests of urine for sugar were negative. The symptoms subsided in the following two months. At the insistence of an insurance company she was hospitalized for three days for diagnostic study. Patch tests and skin biopsies were done and were claimed to be negative. Hospital reports on the cutaneous tests stated that they were positive for nonhemolytic *Staphylococcus aureus*. Scrapings taken from between the toes showed the fungus *Trichophyton gypsum* gasper. Skin biopsy was negative for lichen planus. The patch test was done the day before her discharge with roach paste and also a powder believed to be sodium fluoride. This was read negative the next morning the patient was discharged on the next day. Following her return home in the afternoon and during the next day the patient experienced a gradual recurrence of her former symptoms much more aggravated than at any time during which I had seen her. She had an acute angioneurotic edema which required morphine sulfate and epinephrine for relief repeated two or three times. In the next few weeks she had a series of furuncles about the face, neck, chest and arms which did not respond in the usual manner and left scars after the removal of a greenish gray fibropurulent core. The dermatitis about the elbows and shins of the left leg became more and more eczematous. It is now nine weeks since this flare up but the patient still has recurrent furunculosis now very mild and she is improving. I would appreciate any information you can give me as to the proper procedure to follow.

M.D. New York

ANSWER—There is some evidence that this patient was suffering from something more than a dermatitis venenata. The eruption with itching on the flexor surfaces of the arms and legs and on the neck that disappeared with the injection of epinephrine may have been urticaria. The angioneurotic edema experienced later supports this thought.

The erythema and vesiculation on the ankle surrounding an ulcer may have been due to contact with some irritant. This is merely a possibility. The information given leaves in doubt whether the ulcer was present prior to exposure to the roach powder. It seems doubtful that such a severe dermatitis could be produced on one leg without affecting the other unless there was prolonged and accidental contact at the one site. Such phosphorus pentoxide and phosphoric acid are slow to heal because tissues. Their action can be neutralized by warm wet dressings of 5 per cent aqueous solution of sodium bicarbonate. One per cent aqueous copper sulfate solution is useful in a similar way.

"Phossy jaw" is osteitis, periostitis and necrosis of osseous tissue of the mandible less often of the maxilla resulting from phosphorus poisoning. There are toothache, loosening of the teeth and inflammation of the alveolar processes with suppuration. The breath is garlic scented, and there is salivation. Phosphorus poisoning of the jaw does not take place unless there are carious teeth.

The deeper tissue chancres, such as of the jaw, require a protracted contact with phosphorus. As to whether ulceration and irritation such as occurred in this patient after three weeks' exposure is possible is not certain. It is presumed that the patch tests that gave negative results were properly made. It would have been better if the sites for these tests had been inspected longer than for twenty-four hours, since in some cases there may be delayed reactions. Patch tests, though exceedingly useful have many limitations. Among these is the fact that the conditions of exposure to a noxious agent are not all fulfilled. May this woman have had such a combination in her home with the touch powder which was not duplicated in the patch test with the touch powder alone? She promptly developed a dermatitis on her return home when it may be supposed that the touch powder was removed as thoroughly as possible. If this is a real dermatitis venenata, investigation should not stop with only one suspected agent but should be extended to numbers of others also. It would serve academic interest at least to sprinkle in a limited way some of the touch powder about the house and then observe its effects.

#### RETURN OF MENSTRUAL PERIODS AFTER SEVENTEEN YEARS

*To the Editor*—A patient aged 67 has begun a menstrual flow after a cessation (total) for seventeen years. The flow is bright red with a number of clots at different times. She is free of any discharge or bleeding between the periods, which come every three to four weeks and last about five days. In addition she has become aware of some sexual desire. She is a large obese woman, weighing close to 300 pounds (135 Kg.), and pelvic examination is difficult. The vagina is atrophic and small, the cervix is barely palpable and free of any tumors or ulcers, the adnexa seem free, and palpation of the uterus or extraneous tumors cannot be made. Otherwise physically she seems to be in good health. Her one complaint is associated with a frequency and dysuria. Repeated urine samples have shown small amounts of pus from time to time. Antispasmodics relieve the bladder symptoms but not entirely. Is it possible that an ovary could become revitalized at that advanced age or could the pituitary have some influence? What further procedures would you advise for diagnosis and therapy?

Herbert J. Schwartz, M.D., Challis, Idaho

*ANSWER*—This history suggests that the patient may have been receiving estrogenic medication. If such is not the case, there is probably a pelvic newgrowth involving the ovary. Despite the patient's age, it is essential that the exact condition of the pelvic viscera be determined. If examination under anesthesia, including diagnostic curettage, does not yield dependable and sufficient information, surgical exposure of the ovaries by the vaginal route is warranted in such an unusual case, abdominal exploration would evidently present too serious a hazard.

#### PRURITUS WITH DRY SKIN

*To the Editor*—Please send available information on the gland or glands of internal secretion concerned in clearing up a case of long-standing dry, itching skin. The condition did not trouble the patient while she was pregnant and she remained free from the dry, itching skin during that time. Since the termination of pregnancy she has had the same dry, itching skin again. Pregnancy and menstruation are all the result of a balance of several glands, but which one in particular has control or lack of control on the skin of the body? She is not elderly, and kraurosis is excluded.

Ralph J. Petrucci, M.D., Warren, R. I.

*ANSWER*—Hypothyroidism is frequently concerned with the genesis of pruritus with a dry skin, and it is advisable to ascertain the basal metabolic rate of the patient and in addition to local treatment treat any hypothyroidism if present. Scvringhaus investigated the clinical significance of the various glands of internal secretion in relation to diseases produced by the variation in function of any of these glands (*Endocrine Glands and Their Relations to Dermatology, Arch. Dermat. & Syph.* 43:763 [May] 1941). The appearance of various toxic dermatoses, erythemas, purpuras, herpes gestationis and the appearance or aggravation of the neurodermatoses is often noted in pregnancy. The possibility of pruritus humilis or its variant bath pruritus must also be considered in this case. These conditions are more common during the winter months, and in pruritus humilis there is more or less generalized itching, which appears during the winter and clears up during the summer. Bath pruritus is also more common during the win-

ter months, and the itching in these cases occurs frequently after taking a bath and is not persistent. A general discussion of the causal factors in pruritus and a classification of a number of the etiologic possibilities are given by Wien, M. S. (*Pruritus in Medicine and in Dermatology, Illinois M. J.* 81:125 [Feb.] 1912).

#### HYDROCHLORIC ACID ADMINISTRATION AND GASTRIC ACIDITY

*To the Editor*—Will diluted hydrochloric acid U. S. P. in the usual size doses of 1 to 4 cc. really change the pH of the gastric secretions?

N. M. DeVaughn, M.D., Augusta, Ga.

*ANSWER*—It is generally agreed that the ordinary doses of diluted hydrochloric acid U. S. P. are ineffective in producing material change in the pH of the gastric contents. Kern, Rose and Austin showed that the 1 cc. dose failed to produce any free acid to Lopter's reagent or any change in the pH. Shay and Gershon-Cohen found that 5 cc. of diluted hydrochloric acid when administered with an Ewald meal to persons with acidity, failed to show free acid at any time during the test or pH readings in the free acid range, i. e. 3.5 or lower. Even the slight changes produced by large doses are evanescent in effect, owing to the buffering capacity of gastric mucus, to dilution changes and to emptying of the stomach.

It is exceedingly difficult to ascribe any improvement following the administration of diluted hydrochloric acid U. S. P. to changes produced in the acidity of the gastric contents.

#### PROBABLE DENTAL FLUOROSIS

*To the Editor*—A fourteen year old girl has dead-white, brittle or friable teeth with none of the usual glistening enamel. What should be done and what is the probable cause? Temporarily I have advised calcium gluconate (since she cannot drink milk), vitamin C and, to some extent, vitamin D. She may need riboflavin or vitamin A or both, I do not know. There is no evidence of endocrine disturbances.

Matthew Korasek, M.D., Shidler, Okla.

*ANSWER*—It would appear that the case described is one of a mild to moderate dental fluorosis caused by the use of a domestic water containing excessive amounts of fluorides during the period of tooth development (Dean, H. T. Chronic Endemic Dental Fluorosis, *THE JOURNAL*, Oct. 17, 1936, p. 1269). As this hypocalification occurs during the time of amelification, the post-eruptive therapy outlined would not be expected to improve the condition. Assuming that this is a case of dental fluorosis, the domestic water used by this person during the first eight years of life should be checked for its fluoride content in order to obviate the further development of similar conditions in other children.

#### GLASSES FOR READING IN SUNLIGHT

*To the Editor*—Are there any glasses which are considered suitable for reading in the bright sunlight? Can corrections be incorporated in such glasses?

M.D., Illinois

*ANSWER*—Any glass that reduces the total amount of light coming to the eye can be used for reading in bright sunlight. Most of the leading optical manufacturers have some patented dark glass in which suitable correction can be ground. Despite extensive claims, however, no one glass has been established as possessing qualities that mark it as definitely superior to others.

#### VARYING RESPONSE OF GONORRHEA TO SULFATHIAZOLE

*To the Editor*—Is there any basis for the theory that the blood type has anything to do with the response of a patient to sulfonamide therapy or with the occurrence of undesirable reactions? Is there any explanation why some patients with gonorrhea for example, are cured promptly by sulfathiazole and others not at all?

M.D., M.C., U.S. Navy

*ANSWER*—There is no evidence that blood type has anything to do with the response of a patient to sulfonamide therapy or to the occurrence of toxic reactions. The best explanation of the sulfathiazole treatment of gonorrhea is a difference in susceptibility of different strains of gonococci to the drug.

# JOURNALS ABSTRACTED IN THE CURRENT MEDICAL LITERATURE DEPARTMENT, MAY-AUGUST 1942

Titles have been listed or Abstracts made of important articles in the following journals in the Current Literature Department of THE JOURNAL during the past four months. Any of the journals except those starred will be lent by THE JOURNAL to subscribers in continental United States and Canada and to members of the American Medical Association for a period not exceeding three days. Three journals may be borrowed at a time. No journals are available prior to 1932. Requests for periodicals should be addressed to the Library of the American Medical Association and should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Thus most of these journals are accessible to the general practitioner.

# SUBJECT INDEX

This is an index to all the reading matter in THE JOURNAL. In the Current Medical Literature Department only the articles which have been abstracted are indexed.

The letters used to explain in which department the matter indexed appears are as follows: "BI," Bureau of Investigation, "E," Editorial, "C," Correspondence, "OS," Organization Section, "SS," Student Section, "ab," abstracts, the star (\*) indicates an original article in THE JOURNAL.

This is a subject index and one should, therefore, look for the subject word with the following exceptions: "Book Notices," "Deaths," "Medicological Abstracts" and "Societies" are indexed under these titles at the end of the letters "B," "D," "M," "and S." State board examinations are entered under the general heading, State Board Reports, and not under the names of the individual states. Matter pertaining to the Association is indexed under "American Medical Association." The name of the author, in brackets, follows the subject entry.

For author index see page 1591

## MEDICOLEGAL ABSTRACTS

- ABORTION CRIMINAL** pardoned offense as affecting conviction under habitual criminal act 830
- ADVERTISING** dental guarantees and false and misleading statements 133  
optometric prices of eyeglasses 970
- ALCOHOLISM** See Drunkenness
- ANESTHETICS** nitrous oxide injury to anesthetized patient 901  
osteopaths right to use when blind 903
- ANTISEPTICS** osteopaths right to use when blind 903
- ARSENIC** accident insurance in relation to accidental poisoning 1133
- ASSAULT AND BATTERY** operation unauthorized 748
- AUTOPSIES** privileged communications 1326
- BASTARDY PROCEEDINGS** See Paternity
- BICHLORIDE OF MERCURY** poisoning workmen's compensation 222
- BIOLOGICALS** osteopaths right to use when blind 903
- BIRTH** prenatal injuries liability for 367 1218
- BLINDNESS** diethylphenol as cause of 907  
licensure blind osteopath not entitled to extension of scope of practice 903  
prophylactics failure to use 283
- BLOOD** tests to determine paternity right of privacy 102  
tests to determine paternity self incrimination 102
- CHILDBIRTH** See Malpractice
- COMPENSATION OF PHYSICIANS** workmen's compensation in relation to 222 1133
- CRIMES** See also particular crimes Medical Practice Acts  
habitual criminal act pardon of prior offense effect of 830  
sexual perversion constitutionality of commitment statute 1051
- DENTAL PRACTICE ACTS** advertising guarantees and false and misleading statements 439  
constitutionality when invalidity may be offered as defense 103  
injunctions restraint of enforcement 103  
licenses revocation advertising guarantees and false and misleading statements 439  
licenses revocation nature of proceedings 439  
licenses revocation prejudice of board 103  
licenses revocation specificity of charges 103  
offices personal attendance requirement valid 531
- DIPHTHERIA** blindness attributed to 903
- DOCTOR** sanctor as embraced by term 288
- DRUGS** diethylphenol blindness 903  
osteopaths right to use 1446
- DRUGKENSNESS** chemical tests evidentiary value 583
- EVIDENCE** See also Malpractice  
drunkenness chemical tests 583  
witnesses expert opinion based on information supplied by others 1218  
witnesses expert qualifications 533
- EYEGLASSES** see Optometric Practice Acts
- GONORRHEA** blindness following failure to instill prophylactic 288
- HARRISON NARCOTIC ACT** exempt preparations records 748  
osteopaths right to registration 1446  
records exempt preparations 748
- HOSPITALS CHARITABLE** hydrotherapy pneumonia and tuberculosis following treatment 830  
liability in general 520  
taxes office of physician in hospital 1448  
taxes part of property undeveloped 1448
- HOSPITALS FOR PROFIT** burns cauterizing apparatus defective 971  
cauterizing apparatus defective 971  
equipment defective cauterizing apparatus 971  
hydrotherapy pneumonia and tuberculosis following treatment 830  
mental incompetents death of 1132
- HOSPITALS GOVERNMENTAL** administrative duties negligent performance of 521  
infirmary for nurses injury to sick nurse liability 521  
Magendie's solution administration of decomposed solution 521  
nurses liability for injury to 521
- HOSPITALS IN GENERAL** burns electric lamp 920  
detention of patient physician's liability 290  
medical and administrative acts differentiated 1132  
medicine right to practice 1132  
records attending physician has control of 1132  
records privileged communications 1326  
records production in court compellable 1132
- INDIGENTS** senior citizen grants medical and optical care 288
- INFANTILE PARALYSIS** operation on child ordered by court 520
- INFANTS** medical services court's right to order 520  
prenatal injuries liability for 367 1218
- INJUNCTIONS** dental practice acts restraint of enforcement 103
- INSANITY** civil self inflicted injuries liability of sanatorium 1132
- INSURANCE ACCIDENT** arsenical compound mistakenly injected 1133
- INSURANCE ACCIDENT**—Continued  
poison intravenous injection by mistake 1133
- INSURANCE LIFE** health of applicant fraudulent misstatement 1526
- INTERNS** privileged communications 1326
- LONGSHOREMEN'S AND HARBOUR WORKERS COMPENSATION ACT** malpractice award as bar to action 227
- MAGENDIE'S SOLUTION** decomposed solution administered in hospital liability 521
- MALPRACTICE** abandonment of patient 1052  
aftercare embolism attributed to lack of 810  
anesthetics injury to anesthetized patient 901  
assault and battery operation unauthorized 748  
birthmark mistake in diagnosis 103  
birthmark radium treatment as cause of in jury 107  
burns delay in skin grafting 671  
burns diathermy 1327  
burns foot drop attributed to negligent treatment 671  
childbirth eclampsia alleged abandonment of patient 1052  
childbirth ophthalmia neonatorum failure to instill prophylactic 288  
childbirth roentgen ray injury to fetus 367 1218  
chloroform abuse of drug by epileptic patient 1448  
conspiracy detention of patient in hospital 210  
consultants liability of referring physician 671  
contributory negligence failure to consult physician 1137  
cure failure no evidence of negligence 368  
dentists injury to anesthetized patient 901  
dentists roots of teeth not removed limitation of actions 1219  
diagnosis mistake in 103  
diathermy burns 1327  
eclampsia abandonment of patient 1052  
epilepsy abuse of drug on advice of chloroform 1448  
evidence delay of 12 years in suit by infant 103

evidence witnesses expert qualifications determinable by trial court 901  
eye keratitis attributed to failure to remove foreign body 1447  
foreign bodies keratitis attributed to failure to remove 1447  
fractures res ipsa loquitur 368  
hip infection delay in aspirating 289  
hospital equipment defective liability for injury from 971  
hospitalized patients detention unjustifiably in hospital 290  
joint liability of physician and technician 1527  
judgment of physician criteria of liability when judgment exercised 671  
keratitis failure to remove foreign body from eye 1447  
limitation of actions accrual of right of action 103 1219  
limitation of actions delay of 12 years in suit 103  
limitation of actions operation unauthorized 748  
negligence causal relation to injury 289  
nitrous oxide injury to anesthetized patient 901  
operations liability of referring physician 671  
operations unauthorized limitation of actions 748  
ophthalmia neonatorum prophylactic failure to instill 288  
phenobarbital abuse by epileptic on advice of chloroform 1448  
pneumonia hip infection as sequela 289  
prenatal injuries liability 367 1218  
prophylactic failure to use followed by ophthalmia neonatorum 288  
radium facial blemish treatment as cause of injury 103  
records production in court compellable 1132  
roentgen rays fetus injured by 367 1218  
roentgen rays treatments resulting in injury limitation of actions 103  
scleroderma radium treatment as cause of injury 103  
silver nitrate failure to instill in eyes of baby 288  
skin grafting delay in following burn 671  
teeth roots not removed by dentist limitation of actions 1219  
tonsillectomy embolism attributed to negligent aftercare 840  
uterus removal unauthorized limitation of actions 748  
verdicts directed evidence to be considered 671  
workmen's compensation in relation to 223
- MEDICAL PRACTICE ACTS** codification effect of 533  
construction effect of codification 533  
crimes pardon in relation to revocation of license 971  
educational requirements boards right to establish 672
- MEDICAL PRACTICE ACTS**—Continued  
hospital's right to practice medicine 1132  
indictment bill of particulars when obtainable 1051  
indictment generality of charge 1051  
licenses revocation abortion criminal 1117  
licenses revocation assisting unlicensed technician 571  
licenses revocation bad moral character conviction of crime 571  
licenses revocation codification of laws in relation to 58  
licenses revocation failure in application to disclose commission of abortion 1117  
licenses revocation findings of licensing board of another state 1117  
licenses revocation pardon after criminal conviction 571  
licenses revocation statutory enumeration of crimes not exclusive 571  
pardon effect on revocation proceedings 971
- MEDICAL SERVICES** court's right to order operation on child 520  
sanitary care as constituting 288
- NARCOTICS** See also Harrison Narcotic Act  
Magendie's solution administration when decomposed 521  
osteopaths right to use when blind 903  
workmen's compensation in relation to death due to overdose 901
- NURSES** See also Hospitals Governmental  
workmen's compensation in relation to 521
- OBESITY** diethylphenol as cause of blind ness 903
- OPTOMETRIST** optical care right of practitioner to render 289
- OPTOMETRIC PRACTICE ACTS** advertising prices of eyeglasses 970  
eyeglasses advertisement of price 970  
eyeglasses selection of by customer 970  
indictment generality of charge 1133  
indictment patient's name must be alleged 1133
- OSTEOPATHY** abortion criminal pardon of prior offense conviction under habitual criminal act 830  
anesthetics blind osteopaths right to permit to use 903  
anesthetics right to use 1446  
antiseptics blind osteopaths right to permit to use 903  
as taught in osteopathic schools construction of rights conferred 1446  
biologicals blind osteopaths right to permit to use 903  
blindness of practitioner precludes extension of scope of practice 903  
drugs right to use 1446  
licenses blind osteopath not entitled to extension of scope of practice 903  
narcotics blind osteopaths right to permit to use 903  
narcotics registration under Harrison Narcotics Act 1446  
obstetrics right to practice 1446  
scope of practice court may resort to osteopathic writings and pronouncements 1446  
scope of practice expert testimony inadmissible 1446  
scope of practice in general 1446  
surgery blind osteopaths right to permit to practice 903  
surgery right to practice 1446
- PARDON** habitual criminal act effect of pardoned offense 830
- PATERNITY** blood grouping tests right of privacy 102  
blood grouping tests self incrimination 102
- PHARMACY PRACTICE ACTS** educational requirements boards right to establish 672
- POISONING** accident insurance in relation to accidental poisoning 1133  
bichloride of mercury workmen's compensation 222
- PRIVACY** right of blood grouping tests 102
- PRIVILEGED COMMUNICATIONS** autopsy reports 1526  
hospital records 1526  
interns 1526  
medical attention physician may testify as to fact of 1526
- RABIES** vaccine death following administration 440  
vaccine manufacturer's duty to warn against ill effects 440
- ROENTGEN RAYS** See Malpractice
- SANITARY** medical services in relation to 288  
practitioner as doctor 288
- SEXUAL PERVERSION** commitment of criminal pervert constitutionality of statute 1051
- TAXES** hospitals charitable office of physician in hospital 1448  
hospitals charitable part of property undeveloped 1448
- VACCINE** antirabic death following administration 440  
ill effects manufacturer's duty to warn against 440
- WORDS AND PHRASES** as taught and practiced in legally incorporated colleges of osteopathy 1446  
doctor 288  
remedial aids 1446  
surgery 1446
